Saving of 20 per cent in weight of material is gained by use of upset forgings compared with hammer, hydraulic or other types, forging manufacturer estimates. And production is greatly increased, he adds.—Page 1513.

* * *

Saves fuel by heating core ovens with two unequal gas burners. Small burner holds oven to temperature when not in use. Large high-pressure burner, hooked to temperature control, is used when baking cores.—Page 1516.

* * *

Premium or bonus basis of compensation is used by less than 10 per cent of manufacturing firms investigated. Of that proportion, 99.1 per cent said the bonus cut their costs and increased employee earnings.—Page 1520.

* * *

Aluminum forgings require highly polished dies, and greater care is necessary in preparing stock for forging than in the case of steel. Forgings are heat treated at 960 deg. Fahr.—Page 1522.

* * *

Stops gas leaks from open-hearth furnace settings by use of a new plastic sealing material. Walls can expand and contract without breaking or cracking the joints.—Page 1522.

Sometimes you lose money by having holes pierced in forgings during the upsetting operation. It may pay to make the forging solid and drill the holes.—Page 1514.

* * *

Build the motor into the machine instead of applying it externally, engineer suggests. Predicts a revolution in machine design, and declares machinery builders will make electrical parts for their products, due to intimate relation of the motive power to other parts of the machine.—Page 1524.

* * *

Copper welding made easier and stronger by using deoxidized copper. But conductivity is reduced.—Page 1524.

* * *

Confidence has been reestablished, says President Hoover. But "measures taken must be vigorously pursued until normal conditions are restored," he tells Congress.—Page 1531.

* * *

Strength and toughness of gray iron are increased by molybdenum. Machinability is not notably decreased until molybdenum reaches 1.5 per cent.—Page 1508.

* * *

Increases capacity of containers used in heat treating small parts by eliminating cylindrical screen. Air circulated by fan in bottom of furnace is forced through the work, instead of through screen.—Page 1506.

* * *

Mild steel parts, with aluminum driven into surface (calorizing), will resist oxidation at temperatures up to 1650 deg.—Page 1511.

* * *

You can save money on your forgings by calling on a competent forging expert to go over new designs. A minor change may simplify die construction, increase production and reduce costs markedly.—Page 1514.

Production can be increased about 5 per cent by eliminating speed variations caused by belt slippage, says engineer. Variation may be 6 per cent above or below normal, due to stretching and temperature and humidity changes.—Page 1523.

* * *

Group incentive method of compensation has gained rapidly in past three years, investigation reveals. Automotive, heavy machinery and light machinery industries are principal users.—Page 1520.

* * *

Pressure for lower costs will not lessen, whether business gets better or worse. So now is the time to rearrange your plant for more efficient production.—Page 1538.

* * *

"Why did the steel wire break?" Failure of wires in main cables of suspension bridges is a mystery that may never be solved. Bureau of Standards' investigation may be made too late, as the evidence may even now be evaporating.—Page 1539.

* * *

Sees wide uses for new crack-proof, hammer-proof, acid-proof lacquer, which will withstand even boiling hydrochloric acid. Promises to compete with rust-proof metals.—Page 1518.

* * *

Corrosion of steel in high-pressure boilers proceeds at a negligible rate, tests reveal. Fears that high steam pressures and temperatures dangerously accelerate corrosion prove unwarranted.—Page 1525.

* * *

Sharp drop in number of blast furnaces in operation. On Dec. 1 there were 177 furnaces in blast, a net loss of 26 for the month. Average daily pig iron output for November was 106,047 tons, 8.3 per cent under October.—Page 1542.

ESTABLISHED 1855

Now For Plant Revamping

THE extent that consumer buying power will be crippled by the stock market crash cannot be measured. But whether this setback proves greater or smaller than now estimated, business has an opportunity to put its house in order. Here and there manufacturers already have taken steps to rearrange plant layouts for more efficient production. Increasing numbers are on the way to replace obsolete or obsolescent equipment. A typical case, representing a community movement, is that reported from Youngstown in the news pages of this issue.

Fortunately American corporations, at least the larger ones, were never in a better cash position to undertake such a rehabilitation program. And the assurance that they intend to go ahead with improvements is not to be interpreted as mere propaganda; it reflects a long-range view, which does not allow temporary business fluctuations to interfere with plans to keep pace with the country's growth and to meet the ever-increasing pressure for lower costs.

The President's conferences did well to direct attention to the fact that much of the business of the country is of this character and is not immediately dependent on consumer demand. As the National City Bank of New York points out, "the sponsors of such undertakings are not disturbed by a few months' dip in business, for they know that the added facilities will soon be needed." Work of this kind, moreover, will encounter no financial obstacles, thanks to large corporate cash reserves and easier money rates.

Some of these programs, notably those of the railroads, are now under way. Others may require two or three months before they can be set in motion. Meanwhile business recession may increase or diminish according to the force of factors not yet susceptible to measurement. But the projects undertaken will prove an important offsetting influence and at the same time will be economically justified. It is axiomatic that if competition is to become keener more efficient plant and equipment are needed. Likewise, if mass demand is to grow—as it surely will sooner or later—ways of making mass goods more cheaply must be found.

Throughout the first nine months of this year plant managers in a number of leading industries were under pressure to get out a maximum production. Surely many defects in layout, methods and equipment were disclosed which, under the stress of the period, could not be remedied. Now management has the opportunity to put into practice what its experience recommends. While small companies, as a rule, cannot undertake long-range programs, such as large corporations plan, they can do much to put their plants in top notch shape for the next period of business activity.

The Status Quo of Trade

EFFORTS now being made to mitigate ill effects of the stock market collapse are not intended to restore or preserve the status quo of trade for several reasons. The simplest of these, and all-sufficient, is that there was none. General trade had been engaged in a short-term swing.

What really occurred is readily remembered and is measurable by trustworthy statistics. With minor interruptions there was active and healthy trade, slowly expanding with the increase in population and increase in efficiency from late in 1922, after the slump and readjustment, until about the middle of last year. Then activity, making allowance for seasonal variation, began to increase in various lines in an unusual manner. That special activity reached its height during the second quarter of this year, and for about four months preceding the crash in the stock market a recessive tendency was plainly observable, although it was slight. Obviously it was quite insufficient to measure against the almost vertical drop in the stock market.

Steel production pursued an unusual course. Precedents had been so clear that it was regarded as almost unavoidable that July should be the low month, with August no more than a trifle better, but last year June was the low month and August was 7½ per cent above June. October made the very unusual showing of being the top month of 1928.

In the first half of this year the special swing was still more pronounced. The second half of last year made a new record for second-half steel production by 12.5 per cent, but the first half of this year made a new first-half record (with proper allowance for an odd working day) by 17.6 per cent. Both percentages, particularly the latter, were so large for these latter-day times in steel as to be unusual or abnormal.

With a swing lighter than in steel, but still plainly marked, the Federal Reserve Board's index of industrial production, manufacturing and mining, made a similar showing. During the period of slowly rising activity it advanced about two points a year, whereupon beginning with July of last year it took a special trend upward. The index is adjusted for seasonal variation and it had its peak last June, declining five points from June to September.

The state of trade during, say, the second quarter of this year was one thing, the highest. The state of trade in early October, before the stock market slump, was another and lower thing. The state of trade one year ago was another thing. All were above the points that would be indicated by constructing a general trend line for the seven years of activity we have had since trade got on its regular post-war basis.

Thus there is no particular status quo to be selected as something to be aimed at. The objective should be,

and doubtless is, to give economic laws an opportunity to work unimpeded by adverse sentimental influence.

Economic Unbalances

THE well-informed London correspondent of the *Wall Street Journal* recently communicated some facts in respect to British agriculture. More than 1,500,000 acres have gone out of cultivation during the last six years. Some farms are being sold for $30 per acre. Many cannot find buyers. More than $40,000,000 was lost last year in general farming. British farmers are in debt to the banks to the amount of $250,000,000. There has been a steady drift from the farms to the towns. At present only 7 per cent of the British people live by agriculture. The only farmers in Great Britain who are prosperous and contented are those who have gone in for intensive raising of special crops and animals. All the rest are groaning and pleading for tariff protection or direct subsidy, which the 93 per cent of non-agricultural population is quite unwilling to grant.

Substituting other numerical expressions, which would alter the statement quantitatively but not qualitatively, this summary of the position of British agriculture and its political aspirations would be an accurate description of American conditions. Naturally there are differences. Great Britain is an importer of foodstuffs. The United States an exporter. The British wheat grower complains that with his small fields and non-mechanization he can not compete with the American. The American wheat grower in turn complains of the competition of the farmers of Canada and Argentina. Here we talk of much larger quantities than they do in Great Britain. Secretary Hyde has just let us know that out of 955,000,000 acres of American farm land only 505,000,000 can be cultivated, while only 350,000,000 produce crops enough to supply domestic needs plus all that we are able to market abroad.

It is evident that the farmer everywhere is under the yoke of economic conditions and that legislation cannot cure his ills. There is little use in bestowing upon him tariff protection if he produces a surplus that must be exported and sold in competition with similar products raised elsewhere. A bounty, naked or disguised, would inevitably lead him to augment his production. If too much of a commodity be produced, with the consequence of low prices, the only corrective is curtailment by extinction of the unprofitable. The labor that is thus released should be diverted to the growing of crops that are needed or else should be attracted to the towns to engage in manufacturing. Each of those movements has been proceeding in both the United States and Britain. Increase in manufacture should result in cheapening of the goods that the farmer as well as other persons have to buy.

Evidently, however, equalization does not work in accordance with theory. The cost of living does not come down. What, then, are the obstructions? Main Street answers, Wall Street. Since the catastrophe of October and November many will not think that so good an answer as previously. The farmers cannot fail to see that the operations of the great mail order houses have done much to reduce the cost of buying. On the other hand it may be perceived that the conduct of labor unions does not reduce the cost of railroad transportation, building, anthracite coal and other essential things.

Who Knows About Wire Making?

IT will be recalled that early this year a number of wires in the main cables of a 1200-ft. suspension span under construction at Mount Hope Bay (near Providence, R. I.) was found broken at the anchorage. The bridge had been finished except for the floor slab; nevertheless it was promptly decided to dismantle the structure and re-erect with new cables, since the number of broken wires was steadily increasing. A similar course was taken on a much longer bridge across the Detroit River, not so far toward completion, because the same variety of wire was also used in this structure.

Both these rebuilt bridges have now been opened to the public, at Mount Hope too late for the summer traffic, but the Detroit bridge full nine months ahead of schedule—truly remarkable feats, reflecting the highest credit to ingenious, energetic and resourceful organizations of erectors and field engineers. Worthy of commendation, too, is the way the firms involved in the matter (wire maker, cable erector and bridge contractor) adjusted the puzzling problem of financial responsibility.

This latter matter was undoubtedly decided on a give-and-take basis, because the cause of the trouble with the bridge wire was not known—is not known even yet. Lacking such exact information, the complex relationship among the various sub-contractors could not be adjusted in any other way than on the broad basis of mutual responsibility for a safe bridge and speedy erection. It is worthy of repetition, then, that great credit is due the courageous executives who could accept a share of the inevitably large financial loss without recrimination and recourse to long and equally expensive litigation.

Now that the bridges are opened and the bills paid, the various parties in the transaction may wish to close the books. But for some silent partners in the transaction—steel wire makers and users generally, bridge engineers and metallurgists—the matter is not settled, nor will it be until a convincing reply is given to the question "Why did the steel wire break?" It is of no use to say that it was quenched-and-tempered wire instead of the patented and cold-drawn material used so satisfactorily in former bridges; prior to the commencement of the failures in the bridge the engineers (among the most competent in America) were convinced that the new material was considerably better than the old. Had the wire been satisfactory after erection, the technical world would have applauded their courage and vision in taking yet one more step ahead.

With the rubbish cleared away, it is now time for the record to be made public, for detailed investigation to get under way, in order that this problem, affecting the fundamentals of wire making and using, be satisfactorily solved. Several hypotheses have been advanced, but none of them explains all the facts fairly easily ascertainable. The wire was not made of inferior steel, since it passed as rigorous tests in process and before acceptance as would be specified for cold-

drawn wire. The wire was not abused during erection, because the erector's gang was composed of experienced, steady workers, yet the failures were concentrated at the anchorage and in a few of the many strands. The wire was not overloaded, because each wire was stressed individually and equally on erection, and the whole cable carried only a fraction of the intended weight.

The supposition that the properties of heat treated steel are evanescent is contrary to experience and metallurgical theory. Heat treated carbon steel wire is not brittle under slow loading, rapid impact or alternating loads less than the fatigue limit—witness the successful performance of millions of valve springs in our gas engines. If the zinc coating on this wire roughened the surface of the steel so that it acquired notch-brittleness, why does not the same zinc coating do the same thing to patented and cold drawn bridge wire? The same query could be raised against the suggestion that it was the acid used prior to galvanizing that really did the damage.

A large quantity of the wire from Mount Hope is now at the Bureau of Standards, sufficient for any amount of laboratory testing. Eventually we will get from that institution an impartial report on the findings, but with the sadly depleted staff now at the bureau an early report cannot be expected. Meanwhile the evidence may be evaporating, if the trouble really is hydrogen or acid brittleness (the most plausible hypothesis yet advanced). Since the wire passed rigid tests before erection in the bridge, is it not reasonable to presume that it will pass rigid tests, after dismantling, at the Bureau of Standards?

We are still of the opinion, expressed in these columns in May, that the real solution is likely to come from a more distant view of the entire process of wire making, and may readily come from some maker or user not too close to bridge wire manufacture. With that in view, two supplemental courses of action are now in order. One, the most immediate and easiest, is to publish the fullest possible account of the manufacture, treatment, tests and erection of the wire cables; not only the unsuccessful ones, but the successful ones which replaced them. This will put the facts in such form that many can read and make suggestions.

A much more fundamental matter, however, is for wire makers to start a research into wire making. So many things about a wire mill are traditional, so little has been reduced to specific data in every step of the process from green rod to finished wire, that the field of research is embarrassing by its very size and vagueness. Such a cooperative research would naturally be directed at other things than a solution of the Mount Hope problem (although this might readily be an eventual by-product). Its main aim would be to help the wire industry to fortify itself with knowledge for the revolutionary changes in the industry which are just around the corner, and to help it avoid the numerous pitfalls which waylay rapid progress—such as, for instance, the failure of heat treated bridge wire.

CORRESPONDENCE

Coke Oven Plants of Soviet Russia

To the Editor: From Leningrad, by way of Moscow and Kharkov, it is 48 hr. to the Don Bas, one of the fertile farming sections of Soviet Russia, but also one rich in coal deposits and at present the source of production in this country of nearly all its metallurgical coke. A visit to its coking plants would probably not disclose anything in the way of technical developments to excite the curiosity of one familiar with American practice, but a short description of such a visit by the writer in June and July of this year may prove of interest.

Generally the ovens are located adjacent to the coal mines and the mine tipple becomes a part of the coal preparation department. It is seldom, however, that one mine is of sufficient capacity to supply a plant, so that a part of the coal must be transported, and this is done either by aerial tramway or in the standard Russian car of 20 tons capacity.

The coals available for coking in this district occur in thin and broken seams, which lie at an angle to the horizontal and at a considerable depth below the surface. Due to the angle at which these coals are found, one shaft may cut several seams of entirely different grades and it is possible to bring coal of 18 to 20 per cent volatile matter out of the same shaft with coals averaging as high as 35 to 40 per cent. Some mines are not even equipped to segregate these different grades, so that considerable care must be exercised to insure a uniform mixture at the ovens. The ash and sulphur contents are exceedingly variable, ranging from 9 to 14 per cent ash and from 1 to 3 per cent sulphur, making washing necessary with but few exceptions. After preparation, the coal mixtures charged to the ovens will average 22 to 24 per cent volatile matter, 10½ to 11 per cent ash and 1 to 2½ per cent sulphur.

The ovens are all of European design, consisting principally of those of the Coppe type, but including also Koppers, Collin, Piette and Piron installations. Some ovens built in 1900 are still operating, but a majority of the plants still making coke were built between 1910 and 1914. Several plants were built during the late war, one at Briansky by war prisoners, but these stood idle during the revolutionary period and the years immediately following, and have only recently been put in operation. All are of fireclay brick construction, of 3 to 9 tons capacity, and operate on a 24 to 48-hr. coking time.

One feature particularly noticeable on all of these plants is the absence of coke handling or screening facilities. Coke is pushed out on either a flat or an inclined bench in front of the ovens and quenched by hose. It is then forked into railroad cars for transportation or, as was the case in many plants, into hand buggies and wheeled to the furnaces nearby. Due to the strong coking characteristics of the coal and the long coking time at which the ovens are operated the coke is blocky and unusually large. It is strong and of a good cell structure.

In line with the country's policy of industrialization and expansion of the steel industry, coke making facilities are being enlarged and the more inefficient plants abandoned. This is evidenced by 100 new Koppers ovens at Gorlovka and 90 new Otto ovens at Rutchenkov that have been operating for the past year. These plants are thoroughly modern in every respect and are well operated, the efficiencies obtained being much better than on the older installations. Four new plants are also under construction, two of Becker ovens, one of Otto, and one of Evans-Coppe.

Buffalo Scrap Dealers Elect Officers

Scrap dealers from central and western New York and northern Pennsylvania attended a meeting of the Buffalo branch of the Institute of Scrap Iron and Steel held Tuesday at the Hotel Statler, that city. It was reported that the Buffalo chapter had contributed its quota to the $50,000 fund being raised to carry on the work of the institute during the next two years.

The following officers were elected: Charles Bock, M. Bock & Sons, Buffalo, president; first vice-president, Louis Hurwitz, Hurwitz Iron & Metal Co., Syracuse; second vice-president, Sol Frankle, Rochester Iron & Steel Co., Rochester; third vice-president, Sol Morrison, Morrison & Risman Co., Buffalo; secretary, John E. Farrell, Buffalo; treasurer, Harry Roblin, Buffalo Housewrecking & Salvage Co. Executive committee, Joseph M. Maher, Pennsylvania Wood & Iron Co., chairman; Nate Jacobs, Max Pressler, Samuel Greenfield, Terry Hanlon, Buffalo; Henry Zachs, Erie, Pa.; David Falk, Ben Rosenthal, Rochester; Abe Nathan, Utica; and Philip Roth, Syracuse.

Appointment of a board of arbitration to settle disputes between dealers and buyers of scrap iron material was discussed. David Schwartz, director of the institute, reported cooperation on the part of the mills with the new plans of the dealers.

Slight Reduction in Use of Electricity

Productive activity in the United States, measured by the monthly electrical energy consumption of 3600 scattered manufacturing plants, is reported by *Electrical World* at 134.6 for October, compared with 135.8 for September. The figures are on the basis of 100 as the average for 1923-1925 and may be compared with 129.5 in October, 1928. All the major products, with the exception of textiles, paper and pulp, rubber, chemicals and shipbuilding, show declines from September.

Metal industries dropped from 149.2 to 145.1, but still remain above the 144.6 of October, 1928. Rolling mills and steel plants, included under metal industries, declined from 152.3 to 144.8, being fractionally above the 144.7 of last year. Other metal-working plants, both ferrous and non-ferrous, dropped moderately from 147.4 to 145, compared with 130.6 in October, 1928.

Automobiles, including the manufacture of parts, fell considerably below the level of a year ago. The October figure is 122.4, compared with 138.1 in the previous month and with 141.2 in October, 1928. Shipbuilding, on the other hand, is the highest it has been for many months, at 134, compared with 114.9 in September, and with only 73.8 last year.

The Week in Business

Drift of Current Financial and Economic Opinion

FEAR, the first effect of the stock market crash, is rapidly giving way to sober judgement. Pernicious rumor, given impetus by distraught nerves and overstimulated imagination, has run its course without serious result, and calm appraisal of the business outlook is now the order of the day.

For this return to sanity the country is largely indebted to President Hoover's conferences. To what extent they will also succeed in forestalling or minimizing business reaction is still an open question. As is pointed out by the National Industrial Conference Board, it would require a revolutionary change in the habits of the population completely to eliminate the ebbs and flows of business activity.

"Between the years 1885 and 1927 there were approximately 13 distinct intervals in which business activity alternately expanded and contracted," the Conference Board adds. "However, the statistical, historical and economic events which brought about these changes have seldom if ever been very much alike."

A New Kind of Business Situation

It is clear that the present situation has little in common with that of the 1920-1921 depression, but it is likewise becoming apparent that it has other characteristics, both favorable and unfavorable, that will materially affect the course of business in coming months.

Actual losses in the stock market, as well as the frozen funds of speculators who saved their margins and still hold their stocks with no prospect of early liquidation, represent a definite, although still unmeasured, curtailment of consumer purchasing power. Another complicating factor is that banks are burdened with "frozen loans." Many of them, according to E. C. Harwood, writing in the *Annalist*, lent heavily to clients on stock and bond collateral which, at present prices, is quite inadequate.

Another imponderable is the extent that consumer inventories were inflated under the dual stimulus of installment selling and Wall Street profits. "The gigantic inflation of the stock market," in the opinion of the *Commercial and Financial Chronicle*, "acted as an inordinate stimulus to trade, raising it to unnatural and fictitious proportions."

Much Business Will Go Ahead Regardless

With consumer buying power evidently hardest hit—and it is still uncertain how badly—by the Wall Street panic, the President's conferences performed a second timely service by focusing attention on the magnitude of activities that will go ahead, regardless of the current status of ultimate consumption. As is well stated by the December survey of the National City Bank of New York, "a large part of the business of the country is not immediately dependent upon buying by the general public, but on the maintenance and improvement of the industries, railroads, telephone systems, light and power plants and municipal properties.

"Undertakings such as these," it adds, "are remote from the stock market and will go forward regardless of its fluctuations. Their sponsors are not disturbed by prospects of a few months' dip in business, for they know that the added facilities will soon be needed. Of far greater importance in shaping up a big construction program is the question of cost of capital, and this is fast solving itself in a manner favorable to enterprise."

Sees Recovery by Spring

The reassuring influence of the Washington conferences, in the view of the Harvard Economic Society, is probably less important than the action of the stock market itself, which has resulted in a stupendous reduction in brokers' loans and rapid easing of money rates, including the lowering of rediscount rates at New York, Boston and Chicago. "The soundness of business conditions and the rapid easing of money," the Society declares, "indicate that even a mild depression is improbable and that what we face is probably a business recession that will terminate by spring."

Large Loss in November Iron Output

Daily Rate Less Than October by 9698 Tons or 8.3 Per Cent—Net Loss of 26 Furnaces Largest Since May, 1924

VERY sharp was the contraction in pig iron output in November. The loss in daily rate from October was 9698 gross tons or 8.3 per cent. The most recent greater loss was 14,090 tons in May, 1925, from April. In net loss of furnaces the November record is the largest since May, 1924. The loss last month was 26 furnaces while in May, five years ago, it was 46 furnaces. Even in April of that year the net loss was 40 furnaces.

Production in November was 3,181,411 tons or 106,047 tons per day for the 30 days, as compared with 3,588,118 tons or 115,745 tons per day for the 31 days in October. The loss in October from September's total was less than 1 per cent. The November output is the smallest this year and compares with 3,302,523 tons in November last year. The daily rate last month is the smallest since September, 1928, when it was 102,077 tons.

Operating Rate on Dec. 1

More drastic than the drop in daily rate was the decline in operating rate on Dec. 1. The 177 furnaces blowing on that day had an estimated operating rate of 98,450 tons per day compared with 113,600 tons per day as the estimated operating rate for the

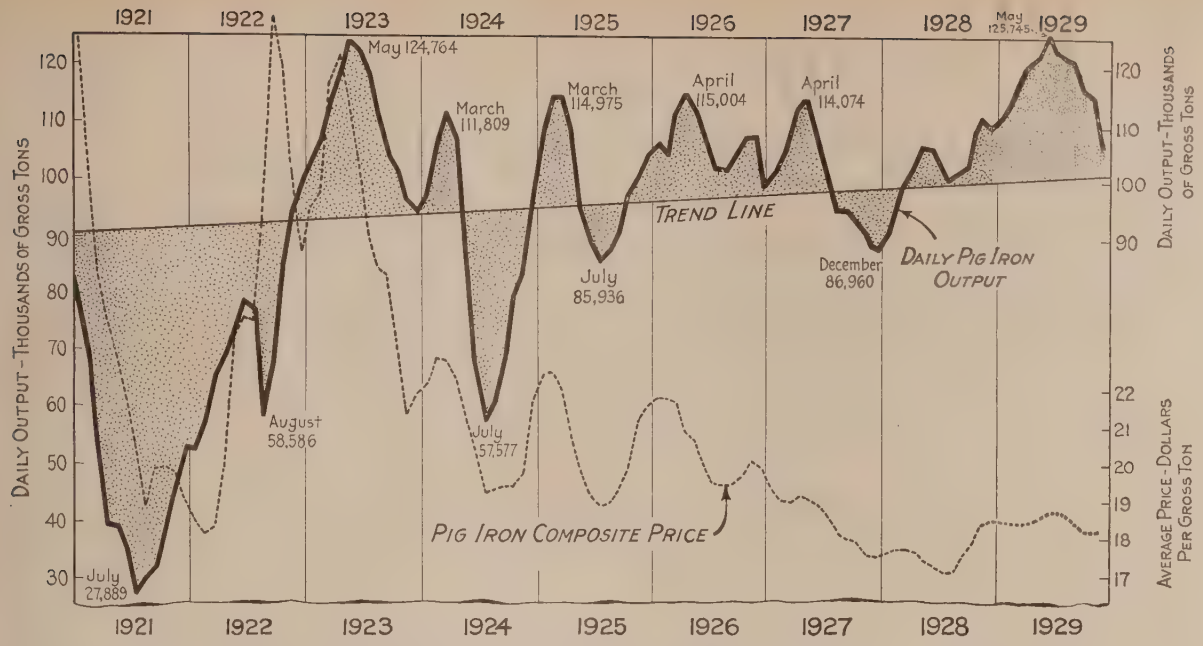
*These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.



For Eleven Months Production of Pig Iron Has Exceeded the Peak of Five Preceding Years

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

203 furnaces blowing on Nov. 1 last.

There were 29 furnaces shut down during November and only three blown in, a net loss of 26. In October the net loss was only two. The loss was confined mainly to steel-making stacks, 24 of the 29 being of that class. There were eight furnaces of the Steel Corporation shut down with 16 belonging to independent steel companies and five merchant stacks. The three furnaces blown in belonged to independent steel companies. The net loss was 21 steel company stacks and five merchant furnaces.

New Record for 11 Months

Even with the large loss in November, a new record for 11 months was made. The total output to Dec. 1 this year has been 39,448,853 tons which is 4,980,895 tons in excess of the same period last year.

Loss in Steel-Making Iron and Ferromanganese

There was a loss of 10,368 tons per day or 11 per cent in the steel-making iron last month. The daily rate was 83,276 tons compared with 93,644 tons in October. Merchant iron made a slight gain.

At 28,285 tons the ferromanganese output was the fifth largest this year and compares with 31,108 tons in October.

Furnaces Blown In and Out

Three furnaces were blown in during November: One furnace of the Wickwire-Spencer Steel Co. in the Buffalo district; one furnace at the Sparrows Point plant of the Bethlehem Steel Corporation in Maryland and No. 2 furnace of the Weirton Steel Co. in the Wheeling district.

Among the furnaces blown out or banked during November were the following: Two furnaces of the Hanna Furnace Co., one furnace of the Wickwire-Spencer Steel Co. and one Lackawanna furnace of the Bethlehem Steel Corporation in the Buffalo district; one furnace of the Bethlehem Steel Co. and one furnace of the New Jersey Zinc Co. in the Lehigh Valley; one Donora furnace of the American Steel & Wire Co., one Carrie furnace of the Carnegie Steel Co., two furnaces of the Jones & Laughlin Steel Corporation, one Midland furnace of the Pittsburgh Crucible Steel Co. and one Monessen furnace of the Pittsburgh Steel Co. in the Pittsburgh district; one furnace at the Cambria plant of the Bethlehem Steel Corporation in western Pennsylvania; one furnace at the Sparrows Point plant of the Bethlehem Steel Corporation in Maryland; the Norton furnace of the American Rolling Mill Co. in Kentucky; two Haselton furnaces of the Republic Iron & Steel Co. and two Campbell and one Hubbard furnaces of the Youngstown Sheet & Tube Co. in the Mahoning Valley; the Sharpsville and one Shenango furnace in the Shenango Valley; one Central furnace of the American Steel & Wire Co. and one River furnace of the Corrigan-McKinney Steel Co. in northern Ohio; one South Chicago furnace of the Illinois Steel Co. and three Gary furnaces in the Chicago district and the Johnson City furnace in Tennessee.

Iron and Steel Markets

Sharp Drop in Pig Iron Production

Decline in Daily Rate Is Largest Since May, 1925—Recession in Steel Output Arrested—Large Rail and Equipment Orders Placed

PIG IRON production contracted sharply in November, reflecting a rapid adjustment of output to reduced demand. Total production was 3,181,411 tons and the daily average was 106,047 tons, the lowest since September, 1928. The decline from the October daily rate, 9698 tons, was the largest reduction recorded since May, 1925. The net loss in active blast furnaces in November was 26, three having been blown in and 29 put out. The greatest net losses in recent years were 40 furnaces in April, 1924, and 46 in May, 1924.

Both iron and steel makers are avoiding overproduction so far as is possible, although some piling of pig iron and semi-finished steel is reported at Chicago. At the same time, unemployment is being kept at a minimum. At Youngstown and at other centers work is being distributed among as large a number of men as possible. Where mills are now running on only one shift, the crews of all three of the customary shifts are being given an equal share of the operating time. Additional employment is being provided by an unusually large amount of repair work, resulting from the heavy strain on equipment in the first nine months of the year.

Steel production as a whole has shown little change, with slight increases tending to offset further reductions. Ingot output at Chicago has declined to 65 per cent, compared with 70 per cent last week, but the rate in the Pittsburgh district continues to range from 65 to 70 per cent. Youngstown production is now estimated at 55 to 60 per cent, compared with 40 to 50 per cent a week ago, while Buffalo operations have dropped from 60 to 50 per cent. The average for Steel Corporation subsidiaries remains at 68 per cent, which also represents the present rate of Bethlehem plants.

Railroad buying is conspicuously good, in contrast with the sharp reduction in the general level of demand. Rail mill backlogs have been augmented by orders for 165,000 tons, and purchases of 6700 freight cars will mean the rolling of 85,000 tons of plates, shapes and bars.

The Southern Pacific has bought 120,000 tons of rails, of which 60,000 tons was placed with the Colorado mill and 30,000 tons each went to the Steel Corporation and the Bethlehem company. The Southern Railway has ordered 44,200 tons of rails from the Alabama subsidiary of the Steel Corporation.

Freight car orders include 5000 bought by the Rock Island, 1000 purchased by the Missouri Pacific and 300 placed by the Milwaukee road. The last named line will buy 3050 additional cars and 30 locomotives, while the Canadian National Railways are inquiring for 3225 cars.

The consistent demand for railroad equipment throughout the fall and the concentration of rail orders, which are ordinarily spread more evenly over the autumn and winter months, have done much to offset the sharp decline in the requirements of the automobile industry and other lines. Shipments of rails from Chicago mills in November were the largest for any month in many years.

Steel specifications from the automotive industry have shown slight improvement and it is now predicted that December production of motor cars will show a gain over the November figure. The change for the better is ascribed to the fact that both the Ford and Chevrolet companies are getting under production in a limited way on their new models. However, recovery of the industry is expected to be slow.

The revival of deferred construction work is the most encouraging market development at Chicago and three projects which came out for figures in that city call for over 29,000 tons of structural steel. Pittsburgh counts on the Washington conferences to result in larger orders, chiefly for structural steel, by February or March. Actual fabricated steel awards for the week, at 12,000 tons, were the lowest of the year, but new work that came into the market totaled 47,000 tons.

The placing of 40,000 tons of plates and shapes for two Leviathan-type vessels for the United States Lines was brought one step nearer by the announcement that the New York Ship Building Corporation submitted the lowest bid.

Tin plate specifications are improving, and the leading producer is running at 80 per cent of capacity, with independents at a 60 per cent rate. Most of the large container manufacturers have placed their contracts for 1930.

Present prices on nearly all of the principal finished steel products have been reaffirmed for first quarter, but consumers are indifferent to their needs for that period and quotations still await a real test.

Scrap markets continue to soften, with heavy melting grade down another 25c. a ton at Pittsburgh.

Pig iron shipments continue to decline, with many foundries now operating on restricted schedules. December specifications from some of the automotive foundries show a gain, but deliveries to other melters tend downward, as the year-end shutdowns for inventories approach. Comparatively little interest has been shown in first quarter requirements.

Ferromanganese has been reduced $5 a ton to $100, seaboard, on contracts for 1930 requirements.

Pittsburgh

Steel Trade Sentiment Improved Though Business Is No Better—Depression Expected to Be Short

PITTSBURGH, Dec. 3.—Sentiment is slightly better in the Pittsburgh district this week, although no improvement in business is reported. The steel industry has been quick to react to the Government's program of business relief, and, although the conferences in Washington are not expected to be translated into orders for steel until February or March, there is a growing belief that the present business depression is going to be short-lived. At the same time, few men in the industry look for any sudden return to peak production, but rather a gradual improvement over the first half of the year, which takes into consideration conservative production schedules on the part of the leading automobile manufacturers.

The automotive industry promises to be a slightly larger user of steel this month than it was in November, as model changes are rapidly being completed in the plants of the two principal makers of cars in the low-priced field and both are expected to get into production before the middle of the month. However, a large part of the steel to be required before the end of the year has either been shipped or is now being rolled and the industry must look to other consumers for the maintenance of demand during December.

The railroads, which are expected to contribute a good share of this demand, are not yet specifying freely, nor are the car companies in the Pittsburgh district, which are now well supplied with orders. The local rail mill cannot ordinarily be expected to reach its full stride before January and February, but this company has thus far been able to maintain a 70 to 75 per cent operating rate producing semi-finished steel and structural shapes. Independent companies are not so well engaged, but, because of heavier releases of tin plate, sheets and strip steel, some have improved schedules this week, following sharp curtailment last week after the holiday.

Under the conditions, the average ingot operating rate in this and nearby districts is still at 65 to 70 per cent of capacity, although finishing mill schedules on sheets, strips and bars are not so high.

Present prices on nearly all the principal steel commodities are being reaffirmed for first quarter business. Consumers are still indifferent to their needs for that period and quotations are being tested only by infrequent spot sales. Sheet makers are taking a firmer stand on prices, and shading on blue annealed sheets, which had become common in the last two or three weeks, is less frequently encountered. The same is true on galvanized sheets, although manufacturers as well as jobbers are still getting concessions of $2 a ton from the formal quotation. The heavy hot-rolled products are holding at 1.90c., Pittsburgh, and strip steel is not quotably lower in spite of some pressure on present price.

The pig iron and coke markets are very dull, but weakness in scrap prices is less pronounced than it was two or three weeks ago.

Pig Iron.—The situation shows no change from the previous week, with buying practically negligible and shipments against old contracts at a reduced rate. Consumers are not yet

showing interest in their first quarter requirements, although buyers are occasionally sounding out the price structure. Producers in this and the Valley districts as yet show no inclination to offer lower quotations for first quarter, and in one or two cases the present schedule of $18.50, Valley, for foundry and basic iron, and $19 for malleable and Bessemer has been quoted on advance tonnage. With several furnaces blown out last month, production is fairly well adjusted to consumption and yard stocks are low. This situation is not conducive to price weakness, as pig iron makers are always more willing to shade prices on the product which is already made than they are on future tonnage.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Shipments to non-integrated companies are still declining as most of these users of semi-finished steel are anxious to reduce their stocks as low as possible for year-end inventories. However, a few companies have already made such reductions and are now forced to take regular shipments of small tonnages as their finishing mill needs require. The price of billets, slabs and sheet bars is unsettled and is still quoted nominally at $35, Pittsburgh or Youngstown. Some tonnage is undoubtedly moving at this figure, but it is not likely that any first quarter contracts have been taken at this price. By the latter half of the month the price will undoubtedly be established by open market transactions. Forging billets are unchanged at $40, Pittsburgh, and this quotation is still holding on small spot tonnages. Wire rods are also quoted at $40, Pittsburgh or Cleveland, and makers have opened their books for first quarter at this figure. Demand for skelp is declining, as pipe operations are lighter.

Bars, Shapes and Plates.—The heavy hot-rolled products are finding a fair demand in the aggregate, with bars exceedingly dull, plates only fair, and structural shapes comparatively good. The outlook for structural business is especially favorable, as steel fabricators expect to benefit as much or more than any other large steel consumers in the Government's program for stimulating business. In the immediate Pittsburgh district an addition to the Bell Telephone Building, recently placed, takes 3300 tons of steel, and there is still prospect for the letting before the end of the year of a bridge across the Ohio River at McKees Rocks, which will require about 13,000 tons of shapes. Several other sizable jobs are in the formative state, and, although some of this work may be delayed until early spring, it will undoubtedly go ahead at that time. This work will also stimulate the reinforcing bar industry, which is now seasonably quiet, and a contributing factor in the dullness of the steel bar business as a whole. Mills in this district are not yet receiving very heavy releases on plates from the nearby car shops, but the car builders have considerable business on their books, and expect to receive more before the end of the year. Some of the barge yards are rather badly in need of business and are now completing most of the barges placed in the summer and fall. Bids will soon be taken by the United States Engineer at Rock Island, Ill., for 20 steel barges requiring about 1300 tons of plates. Some makers of bars, shapes and plates expect to open their books for first quarter this week, reaffirming the present quotation of 1.90c., Pittsburgh, which has been subject to no real test in the last few weeks. As yet buyers are showing little interest in their requirements for the early months of 1930.

Rails and Track Accessories.—Pittsburgh mills have not benefited very largely from recent rail orders, but are now increasing their operations and will soon be making heavy shipments against tonnage placed earlier in the fall. Specifications for track accessories are only fair, but are showing some improvement. Demand for light rails is better than usual for this time of the year, but the aggregate tonnage of this product is not sizable. Prices on track equipment are nominal.

Wire Products.—The wire business is holding at about the same rate as the majority of other steel products. Demand for nails seems to be somewhat better than it was earlier in the year. Jobbers have very low stocks of nails and wire, and are taking carload shipments regularly for immediate delivery. Some makers have closed first quarter contracts with most of their important users at $2.40 to $2.50, Pittsburgh, on nails, 2.40c. on manufacturers' wire, and 2.55c. to 2.65c. on annealed wire. Manufacturers' wire has naturally felt the decline in automotive consumption, but is going into other lines at a fair rate.

Tubular Goods.—Pipe business is not particularly good, but has not felt the sharp decline which has characterized some other steel lines. In fact, demand for merchant pipe, which has been only fair this year, held up much later in the season than usual, and the aggregate tonnage shipped will not fall far under the preceding year. Lap-welded tubing is also feeling the usual seasonal decline, as the period for laying this pipe is limited in many parts of the country, and Pittsburgh mills have now completed shipments against many jobs which served as backlogs during the summer and fall. Seamless tubing is in fair demand, while the mechanical product is very dull. The automobile industry, normally a large user of this product, is taking little or none at this time and airplane makers reduced their requirements sharply several weeks ago. Boiler tubes are moving well.

Sheets.—Specifications for sheet steel still seem to be on the decline, although some companies are rolling some material for stock and are maintaining a fair operating rate. The leading interest last week operated its mills at about 60 per cent of theoretical capacity, but this rate was hardly equalled by the independents, particularly those whose product is

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$10.70
15-lb. coating I.C.	13.40
20-lb. coating I.C.	14.60
25-lb. coating I.C.	$15.90
30-lb. coating I.C.	16.80
40-lb. coating I.C.	18.80

Alloy Steel Bars

(F.o.b. makers' mill)
Alloy Quality Bar Base, 2.65c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

largely full-finished. The automobile industry fails to show any encouraging trends, although the largest maker of cars in the low-priced class expects to get into production by the middle of the month on its new model and will gradually step up production in January. Makers of high-priced cars which were running at a good rate a month ago have now curtailed sharply, and the average output of companies in both the high and medium-price range is well under 50 per cent. Sheet makers have opened their books for first quarter in a quiet way, and are beginning to solicit business for that period. On some finishes a firmer price stand is being taken. Because of the competition of mills rolling sheets by the continuous process, the matter of quoting market prices on blue annealed sheets recently has become complicated. The quotations appearing in THE IRON AGE relate to the jobbing mill product of quality grade. Leading producers of standard blue annealed sheets have reaffirmed their stand for a minimum of 2.35c. a lb., Pittsburgh, for No. 13 gage and 2.20c. a lb. for No. 10 gage, with usual extras. The continuous mill product, which is often sold on a hot-rolled strip steel base, has been quoted at prices from $2 to $4 a ton below these figures. The continuous mill product is made in a limited range of widths and is sold either annealed or unannealed. Quotations shown in THE IRON AGE for blue annealed sheets relate to the standard product. Black sheets are still holding at 2.75c., Pittsburgh, and galvanized at 3.40c. to 3.50c. With some companies the former price applies only to large jobbers, while others are offering it to the manufacturing trade. The 4c., Pittsburgh, price on automobile body sheets is still subject to pressure in the Detroit area, but has not yet been openly broken. Metal furniture sheets are at 4c. to 4.10c.

Tin Plate.—The industry as a whole has not yet increased its operations to any large extent, but specifications are beginning to improve and the leading interest has scheduled its mills this week at close to 80 per cent. Independents are running at about 60 per cent, but in some cases tonnage releases warrant a slightly better rate. Most of the large container manufacturers have placed their contracts for 1930, but a few are still hesitating with some hope of bringing out better prices.

Strip Steel.—Strip business shows little improvement, and the industry as a whole is not averaging better than 30 to 40 per cent of capacity. Some weeks these figures might be lower, but mills which curtail output to a minimum one week can usually expect a considerably better showing in the next comparable period. Last week many of them observed the Thanksgiving holiday and did not resume operations on Friday. The hot mills are better occupied than the cold mills, but this condition is to be expected. Prices are still untested by any significant tonnage buying, but some contracts for first quarter have been taken at 2.75c., Pittsburgh or Cleveland, for cold-rolled strip and 1.90c. and 2c., Pittsburgh, for hot-rolled.

Coal and Coke.—The coke market is in an unsatisfactory state, as production is declining less rapidly than consumption, and distress tonnage is a disturbing market factor. The furnace grade is quotable at $2.65 a net ton, Connellsville, while foundry coke is selling more freely at as low as $3.50. The premium brands are holding at $4.75 to $4.85, ovens. Colder weather during the last week has developed a considerably better demand for heating coke. Coal is also in stronger demand, but domestic consumption cannot offset the sharp decline in industrial demand.

Old Material.—The scrap market apparently has not reached bottom, but price weakness is not so pronounced this week as it has been in the last two. The Baltimore & Ohio Railroad list, which closed yesterday, is understood to have brought $15.50, or slightly better, for the No. 1 heavy melting steel, but this figure undoubtedly represents the top of the market. Dealers are beginning to accumulate yard stocks, for which some of them are paying as high as $15 for strictly No. 1 steel. Lower prices are heard in some instances, but the market is scarcely quotable at lower than $15 to $15.50, a decline of 25c. from last week in the average price. Sale of a tonnage of hydraulic compressed sheets last week by a local producer brought only $14.50, and this marks a sharp decline in the quotations on that commodity. Specialties are still strong, and some dealers are meeting with difficulty in picking up tonnage to cover old contracts. The other grades of scrap are weak and quotations are nominal. The Pennsylvania Railroad list, which closes on Dec. 4, contains 36,700 tons, including 3300 tons of No. 1 heavy melting.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	13.00 to 13.50
Scrap rails	14.00 to 14.50
Compressed sheet steel	14.50 to 15.00
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	17.00 to 17.50
Heavy breakable cast	11.00 to 11.50
No. 2 railroad wrought	15.00 to 15.50
Hvy. steel axle turnings	15.00 to 15.50
Machine shop turnings	10.00 to 10.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	19.50 to 20.50
Railr. coil and leaf springs	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates	20.50 to 21.00
Low phos., light grades	19.50 to 20.50
Low phos., sheet bar crops	20.50 to 21.00
Heavy steel axle turnings	15.00 to 15.50
Electric Furnace Grades:	
Low phos., punchings	18.50 to 19.00
Hvy. steel axle turnings	15.00 to 15.50
Blast Furnace Grades:	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
Rolling Mill Grades:	
Steel car axles	19.50 to 20.50
Cupola Grades:	
No. 1 cast	14.00 to 15.00
Rails 3 ft. and under	17.50 to 18.50

Cement coated nails, per keg	2.95 to 3.05

Belfont Steel & Wire Co. in Receivership

David T. Croxton, vice-president, Cleveland-Cliffs Iron Co., Cleveland, and I. P. Blanton, president, Belfont Steel & Wire Co., were appointed receivers for the Belfont company on Nov. 25 by Judge Robert Nevin, of the United States District Court, Cincinnati. The appointments were made following the filing of a petition for a receiver by Hickman, Williams & Co., dealers in pig iron, scrap, coke and alloys.

The complainant alleged that it is a creditor on a promissory note for $2,000 and on an open account for $1,000. The court was advised that the company also owes $87,197 on promissory notes given to creditors, $377,761 on open accounts and $79,509 as Federal taxes.

It also was said that the Norfolk & Western Railway Co. had brought suit in Federal Court on a note for $5,000 and that similar actions are threatened by other creditors. The complainant further alleged that the company's difficulties are the result of the absence of liquid assets and asserted the belief that the company will be able to meet all indebtedness if permitted to operate its business without interruption.

The Belfont Steel & Wire Co. is one of the oldest steel concerns in Ohio. It was established in 1864 under the name Belfont Steel Co. In 1923, the company was merged with the Kelly Nail & Iron Co., Ironton, and the name was changed to the Belfont Steel & Wire Co.

Chicago

Steel Output Recedes to 65 Per Cent Rate—Railroad Equipment Outstanding in Otherwise Slack Market

CHICAGO, Dec. 3.—The Chicago steel market is experiencing a gradual but definite slackening in demands. This change in the attitude of consumers is not restricted to any one line of steel mill products nor is there indication that any particular group of manufacturers is more affected than others. The recession in shipments is orderly and in a great measure reflects the approach of the inventory period and expected holiday shutdowns more than it does sharp curtailment of buying on the part of ultimate consumers of commodities into which iron and steel enter.

New orders for cars for the Rock Island and the Missouri Pacific will take over 80,000 tons of steel and new inquiries for cars for the Milwaukee road call for 45,000 tons of steel. Included in this week's railroad business is 44,200 tons of rails ordered by the Southern Railway from the Tennessee Coal, Iron & Railroad Co.

The outlook for new building work in Chicago still holds much promise. Although actual inquiries have not been made for some of the larger projects, the trade seems reasonably certain that figures will soon be taken for a large tonnage of structural shapes. Fresh projects made public this week will require an estimated 30,000 tons.

Prices for finished steel are holding, but it is expected that real tests of the situation will be afforded in the next three to four weeks. Books have been opened for first quarter by sheet and wire producers.

Output of steel ingots in this district has receded to 65 per cent of capacity. Some producers are attempting to match output with shipments, but at other steel mills both pig iron and semi-finished steel are accumulating. No. 1 furnace at Gary has been banked. The leading producer is now blowing 13 of 27 stacks, and, for the district as a whole, 22 of 36 furnaces are in blast.

Pig Iron.—Shipments of Northern pig iron are at a lower rate as the holiday and inventory periods draw nearer. While there is this noticeable decrease in total specifications, there is at the same time an increase in demand from malleable foundries, which are finding business more active in the railroad equipment and automobile fields. Sellers are willing to take first quarter business at present prices, but interest in future needs is spotty and variable. Small purchases for immediate needs are in good volume. All merchant stacks in this district are lighted and, in view of the tapering in shipments, stocks at furnaces are growing. The Southern iron market is quiet.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Rails and Track Supplies.—The inquiry by the Missouri-Kansas-Texas for 7500 tons of standard-section rails is still open, according to reports here. Chicago district rail mills are holding to the high rate of production reached in late November. Shipments of rails in the past 30 days were the heaviest for one month in many years. Miscellaneous orders for track supplies total 6000 tons, and inquiries, including 14,000 tons asked for a week ago by the New York Central, aggregate 25,000 tons.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Sheets.—Local producers are opening first quarter books. Several sizable orders for delivery in the next year have already been entered, and sellers find many buyers in a mood to consider future needs. This situation is in contrast with the character of purchases for the quarter now ending. As the third period of this year neared an end, users held out of the market except for immediate needs and they continued to practise hand-to-mouth buying, with the result that mill books in the last two and one-half months have not showed backlogs of satisfactory size. The effect of placing orders in this way is that stocks in the hands of consumers are at an unusually low point, and on this score sheet producers expect to get a quick response in the way of releases with the first impulse of improvement in the general business situation. Prices asked are 2.90c. a lb., delivered Chicago, for black sheets, 3.55c. to 3.60c. for galvanized sheets, and 2.35c. for No. 10 gage blue annealed. Output of local mills is close to 50 per cent of hot mill capacity, which is about the rate at which releases are going to mills. Rolling schedules are at short range, though this situation is somewhat better, as shown by the fact that the Milwaukee hot mills, which have been down for about 10 days, resumed operations on Tuesday of this week. Distribution of sheets by jobbers is less active, as gaged by specifications to mills, though this is not a wholly satisfactory indicator, as at this time of the year jobbers are looking toward reduction of inventories.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Early winter weather in the Middle West has served to cut off small orders, which in recent weeks have been moderately active. Fresh inquiry in and near Chicago is practically at a standstill and sellers can see little in the remainder of this month unless public utilities, which it is understood have new programs that are larger by about 6 per cent than those prepared for 1929, begin to inquire before the opening of the new year. Avon, Ohio, is said to have placed 11,000 ft. of 6-in. pipe with an unnamed bidder. A new project for a sailors' and soldiers' home at Xenia, Ohio, calls for 8000 ft. of 3 to 6-in. pipe. Bids will be opened Dec. 14. There is still doubt whether winter buying prices will be named and, in the meantime, current quotations are unchanged in a very dull market. The early cold snap is resulting in hurried calls for prompt shipment of old orders, and such new business as is before the trade is being placed largely where most favorable deliveries can be promised.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Structural Material.—Recent developments in the Chicago building market lend added support to the belief among fabricators that the present dullness in business is not to last long. It is reported here that the Northwestern Mutual Life Building, Milwaukee, requiring 3000 tons, will soon be out for bids. Prices are to be asked this week on 5000 tons for a traction company bridge at Indianapolis. New projects in Chicago are the Wabash Avenue bridge, which will take 2500 tons; the Chicago Yacht Club, which calls for 1800 tons, and, for the near future, according to re-

ports, 25,000 tons for a new post office and a substantial tonnage for two of the World's Fair buildings, on which construction will be started in the spring. It is the impression of many here that such projects as the National Bank of the Republic Building and a structure for the Marshall Field Estate will also go ahead early in the spring. An encouraging situation recently brought to light by a survey made in Chicago is that rentable vacant property now stands at 4.70 per cent, whereas 10 per cent is usually considered a normal figure. While projects of the character listed here are taking shape, fabricators are faced with shortened hours of shop operation. Architects generally are busier, though their employment of added draftsmen will be set back for the reason that some of the work which they are putting into the market was prepared on drafting boards six months to a year ago. The expansion program of the Illinois Steel Co. is well under way, and steel has been ordered for the fabrication of the first units.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Wire Products.—First quarter books are open, and prices named are 2.45c. a lb., Chicago, for bright annealed wire to the manufacturing trade and $2.45 to $2.55 a keg for wire nails in carload lots to the merchant trade. Insufficient time has elapsed since the opening of books to determine whether buyers are in the mood to make future commitments. In the meantime, specifications scarcely support mill operations at 50 per cent of capacity, a reduction of several points in the week. As to releases by the manufacturing trade, there are indications that the bottom in demand has been passed, though the change is not impressive. Jobbers, especially in the North and at some points in the West, find distribution cut by cold weather. The result is that for the country as a whole specifications from jobbers show a decline from the volume of a week ago.

Cold-Rolled Strip.—Current specifications are holding mill operations to about 20 per cent of capacity. Prices are steady at 2.75c. a lb., Cleveland, or 3.05c., delivered Chicago.

Bolts, Nuts and Rivets.—Among the interesting developments in this market is the fact that automobile parts makers are entering contracts for their needs over the next few months. Prices remain firm and contracts are being prepared on the basis of present quotations.

Plates.—More than 80,000 tons of steel will be required for 6000 cars ordered by the Rock Island and the Missouri Pacific. Five thousand cars were ordered by the Rock Island and 1000 by the Missouri Pacific. Fresh tank steel inquiries total 10,000 tons, of which 3000 tons is for a refinery in Louisiana. Orders for like projects are light in the aggregate for the week, being less than 1000 tons. Shipments of plates are larger to the Milwaukee pipe maker.

Reinforcing Bars.—An early spell of winter weather is serving to check plans for reinforced concrete work which otherwise might have been put under way in the near future. This situation, combined with the fact that this season is normally quiet, leaves bar benders with very small additions to books and a limited amount of new work on which they can prepare figures. Shop operations are at a lower rate than a week ago and further reduction in output is in sight. However, there are bright spots in this market. Easier money promises to support construction work at a higher rate than in the year now drawing to a close and road building programs in the Middle West promise the use of large tonnages of reinforcing bars. Prices for new billet and rail steel reinforcing bars are weak.

Bars.—There is little change in the mild steel bar market. Consumption is still widespread, but purchases are in small lots. Car builders are taking limited quantities in efforts to hold stocks at a low point at the turn of the year. Orders for alloy steel bars are more numerous, but the aggregate tonnage is small, and little support is being lent to mills, which are operating at low rates of output. There is a steady use of iron bars by railroads and car builders. Producers of rail steel bars have opened books for the first quarter at 1.90c. a lb., Chicago Heights. Spot buying is in larger volume, and specifications, though individually small, are greater in the aggregate than a week ago. Although books have been opened, insufficient time has elapsed to gage the interest shown by users in future needs.

Coke.—November shipments of by-product foundry coke surpassed by a small margin the total in October. The December rate is well up to the average in recent weeks. Prices remain steady at $8 a ton, f.o.b. Chicago ovens.

Old Material.—Opinion is divided as to the course being taken by the Chicago scrap market. Sales are unusually small and therefore throw no light on the situation. Most users have been alert to the price situation in recent weeks and, while they may not have accumulated oversized stocks, they are now amply protected for some time to come by orders which are in the hands of brokers. Use of scrap in this district is still at a fair rate, as gaged by shipments and the fact that distress tonnage is giving very little trouble. Two factors which should have a bearing on stabilizing this market are restriction of preparation and shipments of scrap due to cold weather and low production of industrial scrap. Those in the trade who hold that cold weather is an important factor in the winter scrap business feel that zero weather already experienced will curtail shipments enough to lend stability to prices and probably make present quotations a turning point for a stronger market. Shipments to foundries are in smaller volume. This is due in part to the approach of the inventory period and also the fact that many foundries will be closed over the Christmas holiday season. Among railroad lists are 30,000 tons offered by the Pennsylvania on Dec. 4, blank lists by the New York Central and the Michigan Central and 3000 tons offered by the Chicago & North Western.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.00 to 13.50
Hydraul. compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
No. 1 busheling	11.00 to 11.50
Forg'd cast and r'l'd steel carwheels	17.50 to 18.00
Railroad tires, charg. box size	17.50 to 18.00
Railroad leaf springs cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.00 to 18.50
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	14.50 to 15.00
Low phos. plates, 12 in. and under	14.50 to 15.00
Blast Furnace Grades:	
Axle turnings	10.50 to 11.00
Cast iron borings	9.00 to 9.50
Short shoveling turnings	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft.	16.25 to 17.25
Steel rails less than 2 ft.	18.00 to 18.50
Angle bars, steel	15.25 to 15.75
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	16.00 to 16.50
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00

Brake shoes	9.75 to 10.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Reconditioning of Six Ships Authorized

Washington, Dec. 3.—In anticipation of substantial increases in the movements of grain, cotton and flour from Gulf ports to Europe during the next several months, the Shipping Board has authorized the reconditioning of six steel cargo steamers now laid up. The ships will be ready for service within 60 days. The outlay authorized amounts to $414,000. The vessels are the Marne, the West Compo, the West Hassayampa, the West Munham, the City of Alma and the Arden.

New York

Pig Iron Melt Declining and This Is Reflected in Orders—Structural Steel Outlook Bright

NEW YORK, Dec. 3.—Pig iron melt, in the aggregate, is declining. It is difficult to ascertain whether the reduction is due to seasonal or cyclical causes or reflects unsettlement following the stock market crash. The falling off has not been general, however, and may indicate nothing more than the usual curtailment that occurs as the year-end approaches. Suspensions are somewhat more numerous, but, in view of the rather common policy of carrying very light stocks, have not involved large tonnages. Shipments of a leading seller in October were the largest for any month of the year. The tonnage moved in November, augmented by concluding barge canal shipments, was not far behind. With the season of navigation over on the State canal and with the inventory period approaching, the opening of December sees a distinct falling off in the amount of iron moved. Sales of the week in this district were light, totaling 4500 tons, and inquiries are not numerous. The trade is encouraged, however, by the fact that several buyers have tentatively asked for prices on their first quarter requirements, aggregating 3000 to 4000 tons. With furnaces being put out in step with declining demand, sellers believe that the market will be kept free from the weakening effect of large accumulations of stock iron in producers' hands. In the absence of tests the price situation is substantially unchanged. The American Locomotive Co. has placed 500 tons for its Dunkirk, N. Y., works with a Buffalo stack.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.91 to $22.41
*Buff. No. 2, del'd east. N. J.	20.28 to 20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	$19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Reinforcing Bars.—The Turner Construction Co., which has the general contract for the new Ford assembly plant at Edgewater, N. J., has not yet placed an order for the 1000 tons of bars which will be required. Likewise, no award has been made for 1000 tons of bars for an addition to the Pennsylvania terminal and warehouse at Hoboken, N. J. Another good-sized pending job is 600 tons for a warehouse under construction at Newark, N. J., by the Lehigh Valley Transportation Co. The volume of small jobs let in the past few weeks has declined, but prices are steady at 2.05c., New York.

Warehouse Business.—November sales from warehouse stocks were smaller than the October total. Structural steel demand has been steadily receding. Sheets are inactive, but prices are being fairly well maintained, except on blue annealed, which are subject to concessions from the scheduled quotation of 3.90c. a lb., base, to 3.25c. a lb., base, on desirable specifications.

Finished Steel.—A number of mills have begun the solicitation of first quarter contracts, but without much success. Consumers generally are not willing to commit themselves, but whether this policy is dictated by uncertainty as to requirements in the early part of the year or is due to the expectation of lower prices is not clear. Prices are holding fairly well, considering the fact that all mills are anxious for orders. There is naturally some irregularity, but no serious defection. Leading makers of blue annealed sheets have notified local sales offices that minimum prices henceforth are 2.35c. a lb., Pittsburgh, for No. 13 gage and 2.20c. for No. 10. These prices refer to the jobbing mill products, which recently have been brought into sharp competition with the product of the continuous mills. Black sheets are holding fairly well at 2.75c., though occasional sales are made at 2.70c. Galvanized sheets are well maintained at 3.40c. Plate prices are fairly steady at 2c. to 2.05c., Coatesville, the higher price applying on small lots. Some bar quotations below 1.90c., Pittsburgh, have appeared. No definite trend in the volume of business is discernible. Some local offices did better in November than in October, but on the whole the volume of the latter half of November showed no marked change from that of the first half. The structural steel outlook is described by leading fabricators as more favorable than at this time last year. A large volume of work is expected to come out for bids within 60 days, and considerable work on which bids have gone in may be closed before the end of the year. Outstanding among pending jobs is the Empire State Building, which will take 40,000 to 45,000 tons of steel, award of which may be made soon.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.09½c. to 2.14½c.; bar iron, 2.14c.

Cast Iron Pipe.—Prices are still lacking in strength, with most foundries in the North and South in need of tonnage and buying limited to less than carload lots. The only sizable inquiry is for about 1300 tons of 4-in., 8-in. and 10-in. pipe for a city water system in Mexico. Hartford, Conn., has opened bids on about 200 tons of 12-in. water pipe, either sand cast or centrifugal.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—Renewal of contracts for the first half of next year has been general, but demand for carload lots for prompt shipment is small. The price is unchanged at $4.85 a net ton, ovens, for special brands of beehive foundry coke, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44, to New York and Brooklyn. Standard furnace coke is quiet at $2.65 a net ton. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Warehouse Prices, f.o.b. New York

Old Material.—Buying prices show a further downward trend, with brokers in most cases offering only $14 a ton, delivered, for No. 1 heavy melting steel delivered to consumers at Bethlehem or Coatesville, Pa. Heavy breakable cast also shows a decline, brokers offering $13.75 a ton, delivered to a consumer at Florence, N. J., and $13.50 a ton, delivered eastern Pennsylvania. Buying of other grades is unimportant.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$11.00 to	$11.35
Heavy melting steel (yard)	8.00 to	8.50
No. 1 hvy. breakable cast	10.25 to	11.00
Stove plate (steel works)		8.00
Locomotive grate bars		8.25
Machine shop turnings	7.00 to	7.50
Short shoveling turnings	7.25 to	7.50
Cast borings (blast fur. or steel works)	7.00 to	7.50
Mixed borings and turnings	6.75 to	7.50
Steel car axles	15.25 to	16.25
Iron car axles	21.00 to	21.50
Iron and steel pipe (1 in. dia., not under 2 ft. long)		9.75
Forge fire	8.50 to	9.00
No. 1 railroad wrought	12.00 to	12.50
No. 1 yard wrought, long	11.00 to	11.50
Rails for rolling	11.50 to	12.00
Stove plate (foundry)	8.25 to	9.00
Malleable cast (railroad)	13.50 to	14.00
Cast borings (chemical)	9.00 to	9.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$15.00 to	$15.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	13.00 to	13.50
No. 2 cast (radiators, cast boilers, etc.)	12.50 to	13.00

New German Bar Mill Undersells Syndicate

HAMBURG, GERMANY, Nov. 18.—A published report that the Rheinmetall A. G., which has just started operation of a new steel bar mill with a capacity of 35,000 tons annually, has become a member of the German Steel Syndicate is denied by the company. The entire output of the mill, it is announced, is being distributed through Kaufmann & Lipman, steel merchants of this city, at slightly less than the official syndicate prices.

Number of German Blast Furnaces Decreasing

HAMBURG, GERMANY, Nov. 18.—The total number of blast furnaces in Germany continues to decline as old small-capacity furnaces are dismantled and replaced with large modern furnaces. At the end of October there were 182 furnaces in existence, compared with 185 at the end of September. Since 1924, 51 old furnaces have been dismantled and 19 new stacks blown in.

Broken Hill Proprietary Buys German Engines

HAMBURG, GERMANY, Nov. 18.—A contract to furnish six Diesel engines for a new power plant of the Broken Hill Proprietary Co. in Australia has been awarded to Gebrüder Sulzer, leading German manufacturers of Diesel engines. Each motor will develop 2900 hp., and four Diesel compressor engines, also to be furnished in the contract, will develop 1230 hp. The maximum horsepower of the new power plant will be 27,800.

Cleveland

Slight Pickup in Orders for Steel from Automobile Industry —Resumption Expected to Be Slow

CLEVELAND, Dec. 3.—A slight improvement in releases from the automotive industry developed during the week, permitting a little gain in operations by a few of the mills. Others are going along at their recent rate. While the gain is not enough to indicate a permanent improvement, sentiment in the automotive industry in the Michigan territory is much better than a month ago.

December output of motor cars will show a gain over that of November in view of the fact that the Ford and Chevrolet companies are getting under production in a limited way on their new models. However, the pickup in this industry doubtless will be slow. Both the Ford and Chevrolet companies are ordering more steel than last month, but orders from these companies, as well as other automobile manufacturers, are for small lots covering only early requirements.

Stocks of all consumers are low and quick shipment is usually called for. A great deal of steel is still being held up by automobile manufacturers, from which mills are not securing releases.

An independent Cleveland mill that was practically shut down last week is operating at close to 50 per cent this week in both its steel making and finishing mill departments, but another has further reduced its open-hearth operations. Together, local independent mills are operating at about 30 per cent of ingot capacity.

While a few of the bar, plate and shape mills and most of the sheet and strip mills have named present prices for the first quarter, they are not trying to close contracts and consumers are showing no interest in future commitments. Announcements of first quarter prices made during the week included furniture sheets and vitreous enameling stock. Some bolt and nut and rivet makers have reaffirmed present prices for the first quarter.

Pig Iron.—Sales by Cleveland interests were 10,350 tons during the week, compared with 6250 tons the week before. The business was about evenly divided between early shipment orders and first quarter contracts. While some consumers are willing to contract for the coming quarter at current prices, others are holding off to see if present prices are maintained. The market so far appears to be holding firm at recent quotations. The only activity in the immediate territory was the purchase of 500 tons of foundry iron by a northern Ohio foundry at $18.50, furnace, the business being divided between two furnaces. November shipments fell off about 15 per cent, compared with October. Shipping orders from some of the automobile foundries for December show a gain, and this industry is expected to take more iron this month than during last month. However, shipments to other foundries will probably be light this month, as there will be the usual disposition to keep stocks low at inventory time. Many of the northern Ohio foundries are operating three to four days a week. While a few consumers will carry over enough iron to last them well into the first quarter, the aggregate will not be large, as buying for the present quarter was rather light. The American Steel & Wire Co. has blown out one of its Central furnaces in Cleveland. Foundry and malleable iron are quoted at $18.50, Cleveland, for outside shipment and $19, furnace, for local delivery. In Michigan there is a spread of from $19.50 to $20, furnace, for these grades.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25		$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.51 to	20.51
Malleable		19.50
Ohio silvery, 8 per cent		28.00
Basic Valley furnace		18.50
Stand. low phos., Valley	26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6.01 from Birmingham.

Iron Ore.—The Lake shipping season has closed, with a total ore movement by water of 65,195,478 tons, breaking all previous records for shipment by water. More detailed report on ore shipments will be found in another column.

Sheets.—While a few of the mills are operating a little better this week than last, the improvement is slight. Some independent mills in this district are operating at only about 35 per cent capacity. There is a moderate improvement in orders from the automotive industry. Enameling sheets are moving fairly well. The present 3.90c., Pittsburgh, price has been reestablished on vitreous enameling stock for the first quarter. Some mills have named 4c. for metal furniture sheets for that delivery and others are asking 4.10c. Black and

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex.	3.65c.

Black sheets (No. 24)	3.70c. to 3.90c.
Galvanized sheets (No. 24)	4.60c. to 4.75c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb.	$2.65
No. 9 galv. wire, per 100 lb.	3.00
Com. wire nails, base per keg	2.65

*Net base, including boxing and cutting to length.

blue annealed sheets are firmer than recently. The former are holding to 2.75c., Pittsburgh, but the price spread on the latter still exists.

Strip Steel.—A few hot-rolled strip mills are running somewhat better this week than last, but do not have enough tonnage to maintain present operations long. Cold-rolled strip is moving very slowly. Occasional concessions from 1.90c. for wide and 2c. for narrow hot-rolled strip are being made. Cold-rolled strip appears firm at 2.75c., Cleveland. Naming of present prices on hot and cold-rolled strip for the first quarter has not brought out any business for that delivery.

Semi-Finished Steel.—Specifications for billets, sheet bars and slabs are still very light and there is no new business to test prices, nor is there interest in first quarter contracts. Wire rods have been reestablished at $40, Cleveland, for the first quarter.

Wire Products.—A limited amount of wire business has been taken for the first quarter at the reestablished 2.40c., Cleveland, price, which is firm for current orders. Demand is steady, but is for small lots. Nails are inactive.

Reinforcing Bars.—Demand is limited to small lots. The market is weak, a 100-ton lot that was placed during the week having brought out a lower price than had appeared recently.

Bars, Plates and Shapes.—Demand for steel bars continues very light. Some of the mills are doing better in light plates than recently as a result of orders from the automotive industry, but the demand for tank and boiler plate is dull. Shapes continue to move fairly well. New inquiry in the building field is light. Some mills have named present prices on steel bars, plates and shapes for the first quarter and others indicate their willingness to take business at these prices. Steel bars are quoted at 1.85c. to 1.90c., Cleveland, and plates and shapes at 1.90c., Pittsburgh.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Bolts, Nuts and Rivets.—No announcement as to next year's prices on bolts and nuts has appeared. However, no change is expected. Orders are still extremely light, and there is no evidence as yet of an increased demand from the automotive industry. Rivets are moving in fair volume.

Coke.—Foundry coke is inactive, but prices appear to be holding at recent quotations. By-product coke for domestic use is fairly active and is maintained at $4.75, Ohio ovens, for egg and $4.50 for nut. Ohio by-product foundry coke is quoted at $8.25, ovens.

Old Material.—About the only activity is in a limited amount of distress scrap, largely from the Detroit territory, which is being sold at somewhat under prices that have been prevailing. A small lot of compressed sheet steel scrap was sold in Cleveland during the week at $12.50. Dealers are still able to ship a small amount of scrap to two or three mills, although virtually none is being taken by mills in the Cleveland and Valley districts. The market has a weak tone, but in the absence of transactions most quotations are unchanged.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	13.50 to 13.75
Compressed sheet steel	13.50 to 14.00

Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.50
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Consumers of Steel and Pig Iron Delay Contracting—Shipbuilding Active—Ferromanganese Reduced

PHILADELPHIA, Dec. 3.—Steel mill operations still show a tendency to recede, many consumers being inclined to await a definite trend toward business improvement before entering into any commitments for next year. Structural steel buying has slackened. Sheet prices, especially blue annealed, are slightly more stable than a week ago, and mills are not offering as drastic concessions to automobile manufacturers and other large buyers.

Prospective shipbuilding continues a feature of the market, with the New York Ship Building Corporation, Camden, N. J., low bidder on two large ships for the United States Lines, the Erie Railroad about to close on four tugs requiring 150 tons each of plates and the Mathis Yacht Building Co., Camden, N. J., building a private yacht requiring 160 tons of plates.

Ferromanganese.—Effective yesterday, domestic producers of ferromanganese began quoting $100 a ton, seaboard, on contracts for 1930, and British sellers have received instructions to meet the new level on future contracts. Buying for next year's requirements has begun to develop with domestic producers, but importers have not closed much tonnage.

Pig Iron.—Consumers of foundry iron show no interest in contracting for first quarter and in some instances have requested temporary postponement of scheduled deliveries on contracts because of year-end inventories. Delays in contracting for next year are attributed to the lower operating rates of foundries and a resulting surplus of iron due on contracts. The Textile Machinery Corporation, Reading, Pa., has closed on 1000 tons of foundry iron with eastern Pennsylvania furnaces. Prices of foundry iron are unchanged at $21 a ton, base, for small lots, with occasional concessions on desirable business or to meet Southern competition. Demand for low phosphorus iron is fair and furnaces which depend upon foreign sources for supplies of low phosphorus iron ore have been encountering difficulty in obtaining shipments, even on high-priced contracts. The American Steel & Wire Co., Worcester, Mass., recently closed on about 1000 tons of low phosphorus iron with a New York State furnace, and the Brooklyn Navy Yard has awarded 200 tons of low phosphorus to a Delaware River furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Buying is limited to small lots, on which sellers are maintaining 1.90c., Pittsburgh, or 2.22c. a lb., delivered Philadelphia.

Reinforcing Bars.—The number of new projects requiring reinforced con-

crete is decreasing with the approach of winter. Several hundred tons of bars for a bulkhead on the Schuylkill River being built by Philadelphia are reported to have been placed with the Truscon Steel Co. Prices are unchanged at 1.95c. a lb., Pittsburgh, or 2.27c., delivered Philadelphia, for billet steel bars, with the extra for cutting to length usually omitted. Occasionally this price is subject to slight shading. Rail steel bars are quoted at 1.85c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.17c. to 2.27c., delivered Philadelphia, with no extra for cutting to length or bending.

Shapes. — Fabricating shops are still well engaged, but are bidding on a reduced tonnage of new projects. Shape mills are maintaining fair rates of operation on small sizes, but in most cases need tonnage in large shapes. Prices continue at 1.90c. to 1.95c., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c. a lb., delivered Philadelphia.

Old Material.—Buying of all grades of scrap is small, consumers showing no desire to enter into contracts. A Pencoyd, Pa., mill has purchased a small tonnage of No. 2 automobile steel at $13.50 a ton, delivered, and a Phoenixville, Pa., consumer has bought stove plate at $11 a ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$14.50 to $15.00
Scrap T rails	14.00 to 14.50
No. 2 heavy melting steel	12.00 to 13.00
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	13.50 to 14.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	11.00 to 11.50
No. 1 low phos., hvy., 0.04% and under	21.00 to 22.00
Couplers and knuckles	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.00
Shafting	19.00
Steel axles	20.00 to 21.00
No. 1 forge fire	13.00 to 13.50
Cast iron carwheels	15.50 to 16.00
No. 1 cast	15.00 to 15.50
Cast borings (for chem. plant)	14.00 to 14.50
Steel rails for rolling	16.50 to 17.00

Plates. — The price has generally settled to 2c. a lb., Coatesville, Pa., or 2.10c. a lb., delivered Philadelphia, which mills are endeavoring to maintain as the contract price for first quarter. Small lots of miscellaneous specifications still bring 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Sheets.—Automobile body builders in this district have been placing small orders for blue annealed and high finished sheets, but otherwise the sheet market is inactive. Prices are slightly more stable than a week ago and blue annealed sheets are quoted at 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage, and blue annealed plates at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia, for No. 10 gage. Concessions of $2 to $4 a ton are granted to preferred buyers. Black sheets range from 2.70c. Pittsburgh, or 3.02c., Philadelphia to 2.75c., Pittsburgh, or 3.07c., Philadelphia. Galvanized sheets are quiet and the price fairly steady at 3.40c., Pittsburgh, or 3.72c., Philadelphia.

Imports.—In the week ended Nov. 30, 5080 tons of manganese ore arrived at this port from British West Africa and 2024 tons of chrome ore was received, of which 1300 tons came from Greece and 724 tons from British South Africa. Pig iron imports consisted of 1545 tons from British India and 737 tons from the United Kingdom. The only steel arrival was three tons of scrap from the United Kingdom.

Castings, Babbitt and Equipment

New Prices Announced for Ferroalloys

New prices for the major ferroalloys were made effective Dec. 2 and rule for contracts for 1930 requirements. A reduction of $5 a ton on ferromanganese brings the new quotation to $100, seaboard. Prices for ferrosilicon (50 per cent) are unchanged at $83.50 a ton, delivered. There is no change in the price of the higher carbon ferrochromium, which stands at 11c. a lb. of contained chromium on contract and 11½c. for spot delivery. Reductions, however, have been made in the lower carbon grades of about 3c. a lb.

The new quotation on ferrochromium containing 0.10 per cent carbon as the maximum is 26c. a lb. of contained chromium, as against 29c. formerly, and the new price on the product containing 0.06 per cent carbon is 28c., as against 31c. formerly asked. Contracts closed for next year's requirements include some for spiegeleisen at an unchanged price.

Ore Imports Far Above Last Year

WASHINGTON, Nov. 25.—Imports of iron ore in October totaled 270,279 tons, Chile providing 153,283 tons. Cuba ranked second with 46,000 tons and Sweden third with 35,914 tons. The month's total was an increase of nearly 10 per cent from the 246,917 tons of September, and of almost 60 per cent from a year ago.

For the 10 months of 1929 the total incoming movement of iron ore was 2,584,403 tons, against 2,057,103 tons for the corresponding period of last year. Chile supplied 1,351,836 tons in the 10-month period of 1929, against 1,170,100 tons in the corresponding period of 1928.

Ten months' imports this year have exceeded the total for all of last year —2,485,046 tons. Except for 1927, with 2,620,717 tons, and 1923, with 2,768,430 tons, no recent full year has reached the 10-month figure of 1929, and both those years showed smaller 10-month totals than the present.

SOURCES OF AMERICAN IMPORTS OF IRON ORE
(In Gross Tons)

	October		10 Months Ended October	
	1929	1928	1929	1928
Chile	153,283	91,000	1,351,836	1,170,100

Pacific Coast

San Diego Pipe Line Calls for 10,000 Tons of Steel—Prices on Most Products Holding Well

SAN FRANCISCO, Nov. 30.—(*By Air Mail.*)—Activity in the Pacific Coast iron and steel markets this week was interrupted by the Thanksgiving holiday and, as a result, both awards and inquiries fell off. Plate fabricators are interested in the call for bids for approximately 10,000 tons of plates for a pipe line at San Diego. Prices in most lines are holding well, structural shapes and mild steel bars being firm at 2.35c., c.i.f.

Pig Iron. — Foundry operations among the jobbing plants are slack and little new business is coming to hand. As a result, melters are not inclined to order material in advance, most of them having fair-sized stocks in foundry yards. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Most of the reinforcing steel bar awards this week were in lots ranging from 20 to 60 tons. The Soule Steel Co. booked 350 tons for the Sears, Roebuck & Co. building in Oakland. Bids will be opened Dec. 18 for 306 tons for paving work in Los Angeles County. The Puget Sound Bridge & Dredging Co. secured the general contract for the Fourteenth Avenue South bridge, Seattle, calling for 200 tons.

Plates.—The Beall Tank & Pipe Co. secured 370 tons for the Cedar River pipe line No. 2 at Seattle. The only other award of importance called for 300 tons for one 85,000-bbl. tank at the Mount Poco field, Cal., for the Petroleum Securities Co., placed with an unnamed interest. Bids will be opened Dec. 23 for the Otay pipe line project at San Diego. This calls for 36 to 40-in. welded steel, reinforced concrete or cast iron pipe. Steel specifications call for material ranging in thickness from 3/16 to ⅝ in. It is estimated that approximately 10,000 tons will be required. Prices are weak, concessions of $2 to $4 a ton from the nominal quotation of 2.35c., c.i.f., being common on desirable lots.

Shapes. — Bookings of structural shapes this week were considerably below the weekly average for the year. The Pacific Iron & Steel Co. will furnish 500 tons for a new plant for itself at Los Angeles and 110 tons for condenser supports for the Texas Co. at Wilmington, Cal. The Union Pacific Railroad placed 450 tons for a freight depot in Los Angeles with the Minneapolis-Moline Power Implement Co. Dyer Brothers secured 273 tons for a crossing at California Park and 100 tons for a school in San Francisco. The Puget Sound Bridge & Dredging Co. took the general contract for the Fourteenth Avenue South bridge, Seattle, involving 1000 tons. Domestic shapes are firm at 2.35c., c.i.f.

Cast Iron Pipe.—Only two cast iron pipe awards of over 100 tons were reported this week. The National Cast Iron Pipe Co. took 141 tons of 8-in. Class 150 and 16-in. Class B pipe for the East Bay Municipal Utility District, Oakland, Cal. San Diego, Cal., placed 138 tons of 6-in. Class C pipe for Fortieth Street with the Butterfield Construction Co. The American Cast Iron Pipe Co. was low bidder on 1088 tons of 12-in. Class A pipe for Los Angeles. The Griffith Co. was low bidder on 230 tons of 4 and 6-in. Class C pipe for Coronado Avenue, San Diego. The National Cast Iron Pipe Co. was low bidder on 477 tons of 4 to 10-in. Class B pipe for Miramonte Park, Los Angeles. Bids will be opened on Dec. 23 for 3400 tons of 36-in. Class B pipe for the Otay pipe line project, San Diego. Alternate bids will be taken on reinforced concrete and welded steel pipe.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.

Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

St. Louis

Southern Pig Iron Sold for First Quarter—Spurt in Coke Buying—Scrap Market Stagnant

ST. LOUIS, Dec. 3.—Sales of pig iron during the last week were rather light and consisted largely of spot orders for fill-in purposes. A few sales of Southern iron, including one of 200 tons, were made for first quarter shipment, Southern makers having opened their books for next year's business at prices ranging from $14 to $14.50, f.o.b. Birmingham. Makers report that melters are showing some interest in their first quarter requirements, and are optimistic over the outlook for next year. Stove plants, which recently slowed down operations, are hopeful that the cold snap of last week will tend to stimulate buying by consumers and in turn help the manufacturers to resume full operations. Malleable casting plants in the district catering to the automobile industry have curtailed their melt considerably, but the implement business is well sustained.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.42 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—The demand for sheets is not so large as it was a few weeks ago, but the Granite City Steel Co. feels that this is due to a considerable extent to a desire of manufacturers and jobbers to decrease their inventories before the end of the year. Because of weather conditions, the demand for galvanized sheets, a large percentage of which goes into roofing, also has declined. Orders for tin plate have been large, as is expected at this time of year. The demand for plates also has been good. Building construction continues quiet.

Coke.—Cold weather has stimulated buying of domestic grades of coke, and by-product ovens have been enjoying exceptionally good business. Smelters continue to buy heavily of furnace coke, but buying of foundry grades is light.

Old Material.—The market for old material is at a standstill. Not only is there virtually no buying by consumers, but three of the largest mills in the district are asking dealers to withhold shipments against contracts. This the dealers are doing, although some of the railroads are insisting on making shipments of materials bought by dealers against these contracts. Country dealers, too, are being asked by local dealers to withhold shipments. Prices are nominally unchanged be-

Agricult. malleable	14.00 to 14.50
Relay. rails 60 lb. and under	20.50 to 23.50
Relay. rails 70 lb. and over	26.50 to 29.00

Canada

Railroads to Place Large Rolling Stock Orders

TORONTO, ONT., Dec. 3.—Melters showed only passive interest in the Canadian pig iron market during the week. Hand-to-mouth buyers are responsible for the bulk of new business. Orders from such melters are confined to lots of one or two cars. The daily iron melt is holding up much better than was expected a short time ago. Some of the larger consumers have sufficient business to maintain present production rates well into the new year, although there is curtailment of activity in the automotive and implement industries. Canadian pig iron prices are firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—While there is still a good volume of business pending for closing before the end of the year and still other tonnages in prospect for early 1930 closing, the current demand for structural steel is dull. Orders are mostly in lots under 500 tons, and even these are less numerous than formerly. Fabricating plants are running at full time and making large deliveries on old contracts.

Railroad Equipment.—The Canadian National Railways have announced their intention of placing orders for approximately $20,000,000 worth of freight and passenger cars and locomotives for Canadian lines during 1930. Tenders have already been called for on the first lot of the equipment required, and the initial orders will run into several millions of dollars. It is also stated that the Canadian Pacific Railway is preparing to enter the market for rolling stock for 1930 requirements.

Old Material.—Both Toronto and Montreal markets have developed dullness during the past week or 10 days, with new business confined to small tonnages for spot delivery. While no forward delivery booking is being done, melters are taking regular delivery on old orders and the consumption of scrap is holding at a good level. Mills are purchasing heavy melting steel and turnings for immediate needs only. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00

Birmingham

Tennessee Company Books 44,200 Tons of Southern Rail Order— Plates, Shapes, Galvanized Sheets Reduced $1

BIRMINGHAM, Dec. 3.—The movement of pig iron has declined to the smallest volume in weeks. This is partly due to reduced operations by pipe shops and other foundries in the district. The amount of carryover depends upon the length of the holiday shutdowns. Several inquiries for first quarter iron have been received from district consumers. A few small tonnages for first quarter delivery to outside points have been sold at $14. Prices for the district continue on the basis of $14.50. There have been no changes in furnace operations. Nine are on foundry, six on basic and one on rearburizing iron, a total of 16.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—The volume of incoming business is undiminished. In rails, railroad accessories, plates and bars, new business of the last two weeks of November was slightly ahead of that of the first two weeks. Declines were shown in wire and wire products, sheets and some of the lesser important lines. The Tennessee company shared in the new rail orders of the Southern Railway last week to the extent of 44,200 tons, including 11,000 tons of 130-lb. rails, 24,800 tons of 100-lb. and 8400 tons of 85 and 90-lb. Tank plates, structural shapes and galvanized sheets have been reduced $1 a ton. The former two items are now quoted at 2.05c. and the latter at 3.65c. All other prices are the same. Structural steel fabricators have several good projects in prospect for December. The Ingalls Iron Works Co. has booked 400 tons for the S. H. Kress Co. store at Durham, N. C. Reinforcing bar business is at the low point of the year. Active open-hearths total 19, one less than last week.

Cast Iron Pipe.—The American Cast Iron Pipe Co. has booked 800 tons for Los Angeles, Cal., and the McWane Cast Iron Pipe Co., 220 tons for the same city. Other sales last week were in lots less than 100 tons, and the aggregate was light. Plants here are bidding on a 6500-ton project at Detroit to be let this week and a 900-ton project at Memphis, Tenn., also to be closed this week. Richmond, Va., will open bids Dec. 5 for a fair-sized project, and St. Louis is expected to take bids within the next few weeks on several hundred tons. Demand is notably better than 10 days ago, and pressure pipe manufacturers expect continued improvement, with utilities and municipalities showing more interest in their 1930 requirements. It is estimated that operations are about 15 per cent less than they were 30 days ago. Base prices remain at $37 to $38 a net ton, Birmingham.

Old Material.—The movement of steel grades continues up to the average of the past several weeks, though it is light when compared with this time in previous seasons. Iron scrap is dull. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Lewis-Shepard Co., Boston, has appointed the Lincoln Products Corporation, 31 Fulton Street, Newark, as distributers in northern New Jersey for jacklifts, arc-welded skid platforms and stackers for handling material into and out of storage.

Boston

Utility Companies to Buy 10,000 Tons of Pipe —Pig Iron Prices Unsettled

BOSTON, Dec. 3.—Pig iron buying continues small, but indications are business will be better this month. Two Buffalo district furnaces are offering No. 2X at $17 a ton, furnace, but so far have not offered No. 2 plain for less than that price. Furnaces east of Buffalo are meeting $17 a ton for No. 2X. Users of Southern iron are well covered. One Southern furnace is making low prices and foundries are using these as a lever on Northern iron prices. Recent sales included a fair tonnage of Indian iron at $21.50 to $22 a ton, duty paid, on dock here.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$21.91 to $22.91
*Buffalo, sil. 2.25 to 2.75	21.91 to 22.91
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Cast Iron Pipe.—Activity centers in the sounding out of the market for an aggregate of 10,000 tons of pipe by five New England utility companies. Aside from the purchase of a car of 6-in. pipe and a car of 8-in. by Chelsea, Mass., from French pipe makers, no open municipal business was placed the past week. Westminster, Mass., will install a water system in 1930. Prices quoted openly on domestic pipe are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.
Structural shapes—	
Angles and beams	3.365c.
Tees	3.365c.

Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Reinforcing Steel.—Aside from a sale of 500 tons for a New Haven, Conn., job, the aggregate tonnage of billet steel bars sold the past week was again small. Prospects for business are a little brighter, however, as the Maine State Highway Commission will buy 300 tons; 200 tons is wanted for a Worcester, Mass., shoe shop addition, and 125 tons for a Cambridge, Mass., hospital addition, while 200 tons for a Boston electric lighting station and 150 tons for a Providence, R. I., bridge are still pending. The trade openly quotes 2.61½c. a lb., base, from stock on large tonnages of billet steel bars, and 3.16c. on small tonnages. The open market on rail steel bars is 2.26½c. a lb., base, delivered common Boston freight rate points.

Coke.—As anticipated, New England by-product foundry coke companies made no change in their price for December deliveries. It remains at $11 a ton, delivered within a $3.10 freight rate zone. November shipments were somewhat less than those for the corresponding month last year. Domestic coke is in good demand.

Old Material.—Business in scrap for domestic consumption the past week was practically at a standstill. Prices continue to ease off, some shading being noted on T rails, heavy melting steel, steel turnings, skeleton, shafting, axles and chemical borings. Easier prices on chemical borings are attributed to the holding up of shipments by consumers. A steamer with scrap rails and miscellaneous scrap cleared this port the past week for Genoa, Italy. A boat is now loading a similar cargo for Danzig.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.50 to $10.00
Scrap T rails	9.00 to 10.00
Scrap girder rails	8.50 to 9.00
No. 1 railroad wrought	10.50 to 10.75
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	5.50 to 6.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	8.25 to 8.50
Forge flashings	8.50 to 9.00
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	8.50 to 9.00
Shafting	13.50 to 14.00
Steel car axles	15.50 to 16.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	11.00 to 11.25
Cast iron borings, chemical	8.75 to 9.00
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Cincinnati

Pig Iron Purchases Are Restricted to Immediate Needs—Sheet Demand About 50 Per Cent—Scrap Weak

CINCINNATI, Dec. 3. — Continued conservatism among district consumers of pig iron is restricting demand to a minimum. Purchases are small and for immediate needs. During the last week approximately 2500 tons of iron was sold, the bulk of which was in small quantities, generally carload lots, although a few orders of 100 tons or more were reported. A northern West Virginia consumer took 500 tons of Northern foundry iron and the Norfolk & Western Railroad bought 100 tons of the same grade. A Michigan consumer purchased 300 tons of charcoal iron. Price schedules on both Northern and Southern iron are being maintained, although one Southern furnace is reported to be granting concessions of 50c. The lack of inquiry either for immediate needs or for first quarter requirements reflects still further the quietness of this market and is causing some doubt as to any improvement in the near future.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Steel.—New bookings of sheets in the past week were approximately 50 per cent of normal production, and operating schedules were at a rate about equal to the demand. Galvanized roofing material is still leading in current demand, although electrical manufacturers are taking a fair amount of sheets. With unfavorable weather holding up building projects, the demand for fabricated material is low and district fabricators are anxious for business.

Coke.—Movement of by-product foundry coke on contracts last month was approximately 20 per cent under

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.

Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	8.75

	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.50
4-in.	34.50
Seamless steel boiler tubes, 2-in.	17.50
4-in.	36.00

the level of October. Specifications so far this month are about on the same rate and, with the melt still light, oven representatives do not expect any marked improvement soon. Cold weather is stimulating the demand for domestic grades of coke.

Old Material.—Although no changes in dealers' schedules were made last week, dealers are leaning toward the bottom of price spreads in purchases. Further price recessions during the next week are anticipated. Mills are still curtailing shipments of scrap on contract, and business is small. The supply of most grades is ample.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$12.25 to $12.75
Scrap rails for melting	13.00 to 13.50
Loose sheet clippings	8.00 to 8.50
Bundled sheets	10.75 to 11.25
Cast iron borings	8.25 to 8.75
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.50 to 7.00
Rails for rolling	13.50 to 14.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	12.25 to 12.75
Short rails	17.50 to 18.00
Cast iron carwheels	12.50 to 13.00
No. 1 machinery cast	18.50 to 19.00
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Youngstown

Valley Mills Operating at 55 to 60 Per Cent

YOUNGSTOWN, Dec. 3.—Iron and steel companies of the district, following an irregular month in November, entered December with production schedules between 55 and 60 per cent.

Both of the major independents, the Youngstown Sheet & Tube Co. and the Republic Iron & Steel Co., are maintaining this rate. The Sharon Steel Hoop Co. is operating all nine sheet mills at its Haselton plant in Youngstown, its open-hearth furnaces at Lowellville on a 50 per cent basis and its Sharon mills at 55 per cent.

Tin plate and strip capacity in this district is averaging 50 per cent, while independent bar mills and pipe mills are operating at 60 per cent. The outlook is that the industry will continue at this level for the remainder of the year. Sheet capacity in the Youngstown district is not engaged above 50 per cent. Of 51 independent open-hearth furnaces, 20 are active, while 50 of the 120 sheet mills are scheduled for partial engagement.

Japan May Buy Borneo Iron Ore

YOKOHAMA, JAPAN, Oct. 15.—An offer of iron ore from Borneo by a French company is being investigated by the Seitetsu Jo (Government Works), and the head of the Engineering Department of Kyushu Imperial University has been appointed to make a personal survey of the Borneo deposits and render a report as to the advisability of using supplies from that source.

Buffalo

Pig Iron Shipments Hold Up Well but New Buying Is Light —Steel Mill Operations Decline

BUFFALO, Dec. 3. — Although pig iron inquiry has dropped off considerably, shipments are keeping up remarkably well and producers are confident that late this month there will be a fair volume of inquiries for the first quarter. No extended buying movement is expected, however. Among current inquiries from consumers in the immediate Buffalo district is one for 400 tons of malleable; another is for 200 tons of foundry. An inquiry for 1500 to 2000 tons of foundry is expected shortly. The Y furnace of the Wickwire-Spencer Steel Co. has been blown in in place of the X furnace. The Lackawanna plant of the Bethlehem Steel Co. banked a furnace on Sunday, and now has four of its seven furnaces at that plant in operation.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Operation of steel mills in this district has declined. The Lackawanna plant of the Bethlehem Steel Co. is operating at approximately 50 per cent of capacity, with 10 of its 22 open-hearths going, and mills either down entirely or on single turn. The Donner Steel Co. is operating three open-hearths about four days a week, and Seneca Iron & Steel Co. is at about 50 per cent capacity. A few small reinforcing bar jobs are being figured. The contract for school 67, which will require about 175 tons of rail steel, will be let this week. The remainder of the new City Hall reinforcing contract will be rail steel. There is almost an entire absence of structural lettings.

Old Material.—The market is very dull. No important transactions are noted. It is reported that one of the larger mills is out of the market for two months, having accumulated an exceptionally large stock pile. There appears to be a market for machine shop turnings, borings and turnings and cast iron borings, though one sizable order for cast iron borings was suspended recently. Premiums were paid in some instances for shipments of cast iron borings during November. One of the larger consumers of No. 1 machinery cast and stove plate continues to hold up shipments. The Michigan Central Railroad list closes Dec. 3, the Erie Dec. 4, and the Pennsylvania Dec. 4. The Pennsylvania list, which ordinarily includes about 10,000 tons of No. 1 heavy melting steel, will run about 2300 tons this month. Production of scrap in general has dropped off considerably.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	12.50 to 13.00
Scrap rails	15.00 to 15.50
Hydraul. comp. sheets	12.50 to 13.00
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	12.50 to 13.00
No. 1 busheling	12.50 to 13.00
Hvy. steel axle turnings	13.00
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	11.50 to 12.00
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	10.75 to 11.25
Blast Furnace Grades:	
Short mixed borings and turnings	10.75 to 11.25
Cast iron borings	10.75 to 11.25
No. 2 busheling	8.00
Rolling Mill Grades:	
Steel car axles	17.00 to 17.50
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.00 to 12.25
Locomotive grate bars	11.00 to 11.50
Steel rails, 3 ft. and under	17.75 to 18.00
Cast iron carwheels	12.00 to 12.25
Malleable Grades:	
Industrial	16.50 to 17.00
Railroad	16.50 to 17.00
Agricultural	16.50 to 17.00
Special Grades:	
Chemical borings	12.50 to 13.50

Detroit Scrap Weak

DETROIT, Dec. 3.—There have been no changes in the market on old material. The market is very weak. The few sales made are on the low side of the range.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$12.00 to $13.00
Borings and short turnings	8.00 to 8.50
Long turnings	7.50 to 8.00
No. 1 machinery cast	12.50 to 13.00
Automotive cast	11.50 to 12.00
Hydraul. comp. sheets	11.75 to 12.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.00 to 11.50
Old No. 1 busheling	9.50 to 10.00
Sheet clippings	8.00 to 8.50
Flashings	10.25 to 10.75

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

American Electric Fusion Corporation, Chicago, has appointed the R. D. Thomas Co., Philadelphia, as agent for the company's spot, seam and tube welders.

Republic Iron & Steel Co. has leased offices in the new Lincoln Building, East Forty-second Street, for its New York headquarters. Company will move from 17 Battery Place next spring.

Railroad Equipment

Rock Island Buys 5000 Cars and Missouri Pacific 1000

WITH orders placed in the past week for almost 6700 cars and with fresh inquiries for a like amount, indications are that railroad equipment manufacturers will be busy during the winter months. The Rock Island has bought 5000 cars, the Missouri Pacific 1000 and the Chicago, Milwaukee, St. Paul & Pacific 300. The latter road also will buy 3050 cars and 30 locomotives. The Canadian National Railways are inquiring for 3225 cars. The Southern Pacific will spend $8,300,000 for new equipment, including 36 steam locomotives and 400 freight cars, while the New York, New Haven & Hartford will purchase 10 electric locomotives. Details of the week's business follow:

Chicago, Rock Island & Pacific has ordered 5000 freight cars, divided as follows: 1000 composite gondola cars to Pressed Steel Car Co.; 1000 automobile cars to Bettendorf Co.; 500 automobile cars to Standard Steel Car Co.; 1000 box cars to American Car & Foundry Co.; 500 box cars to General American Car Corporation; 500 box cars to Pullman Car & Mfg. Corporation; 250 stock cars and 250 flat cars to Ryan Car Co. This road is considering entering the market for passenger and baggage car equipment.

Missouri Pacific has ordered 1000 steel hopper cars from Standard Steel Car Co. and has 1250 box cars still to purchase.

Chicago, Milwaukee, St. Paul & Pacific has ordered 300 70-ton ore cars from Pressed Steel Car Co. This road will also buy 600 flat cars, 700 box cars, 1000 gondola cars, 750 stock cars, 15 freight locomotives and 15 passenger locomotives.

Great Northern has ordered 200 flat cars from Standard Steel Car Co.

Swift & Co., Chicago meat packers, are inquiring for 300 steel underframes for cars.

Atchison, Topeka & Santa Fe has ordered 100 tank cars from General American Tank Car Corporation.

New York, New Haven & Hartford has appropriated $3,500,000 to finance the purchase of 10 electric locomotives and 35 multiple-unit passenger cars and trailers.

Southern Pacific will expend $8,300,000 for new equipment to include 35 steam locomotives, two electric locomotives, 47 units of passenger train equipment, 400 freight cars, also cranes, ditchers and steam shovels. Company will build 60 caboose cars and 20 locomotive tenders in its own shops.

Canadian National Railways are inquiring for 3000 box, 200 refrigerator and 25 tank cars.

St. Louis-San Francisco has ordered 10 baggage-mail cars from American Car & Foundry Co.

St. Louis Southwestern will buy 10 4-8-4 type locomotives.

Chicago & North Western will buy one derrick car.

Otis Steel Contracts For Continuous Sheet Process

The Otis Steel Co., Cleveland, is planning for the erection of a continuous rolling mill for the manufacture of sheets and strip steel under the process controlled by the American Rolling Mill Co., Middletown, Ohio. The board of directors of the Otis company has authorized the closing of a contract with the Middletown company to use the latter company's rolling process.

Details of the plant extensions and equipment have not been worked out, but the Otis company plans to start on the construction work early in the year. The erection of plant additions and the new rolling equipment will involve an expenditure of $10,000,000, according to an announcement of E. J. Kulas, president of the Otis company.

Strong Aluminum Alloys for Warships

Since the weight of warships has been restricted to 10,000 tons displacement by the Limitation of Armament Conference, the weight-saving possibilities of aluminum have been of special interest to the United States Navy, says a recent bulletin issued by the Navy Department, Bureau of Engineering.

"Duralumin is a striking alloy," the bulletin continues. "In the wrought condition and when properly heat-treated it has the properties of structural steel with about one-third the weight." Acetylene welding of duralumin at the naval aircraft factory, at Philadelphia, has been developed to a satisfactory state. General methods of welding and of riveting duralumin sheet are also outlined in the bulletin.

Production, Shipments and Consumption

	October, 1929	September, 1929	October, 1928
Steel furniture shipments(a)	$2,971,004(b)	$2,333,984	$3,158,998
do., do., ten months	28,395,643	.....	29,071,961(c)
do., new orders(a)	2,855,588	2,290,133	3,192,927
do., unfilled orders(d)	2,067,212	2,055,457	2,095,139
Steel shelving shipments(a)	979,236	842,635	953,804
do., do., ten months	9,606,302(c)	.....	7,590,062
Electric power production(e)	8,685,131(c)	8,059,874	.....
Whereof, by water-power	2,724,872	2,471,369	.....
Coking coal consumed at by-product plants, net tons(f)	6,658,006	.....	6,098,028

(a) United States Department of Commerce. (b) Largest since last February. (c) Largest on record. (d) End of month. (e) United States Geological Survey; quantities are in thousands of kwhr. and represent output of public utility plants. (f) United States Bureau of Mines.

Reinforcing Steel

Awards Total 1400 Tons and Inquiries 3500 Tons

CONTRACTS for reinforcing steel in the past week totaled only 1400 tons. Inquiries appeared for 3500 tons, of which 1000 tons is for a freight terminal and warehouse at Hoboken, N. J. Awards follow:

NEW HAVEN, CONN., 500 tons, incinerator plant, to an unnamed fabricator.

CAMDEN, N. J., 125 tons, underpass at approach to Delaware River bridge, to Truscon Steel Co.

CLEVELAND, 110 tons, footings for National Town and Country Club, to Bourne-Fuller Co.

EAST MOLINE, ILL., 100 tons, school, to Laclede Steel Co.

ST. LOUIS, 100 tons, Coca-Cola bottling plant, to Laclede Steel Co.

ST. LOUIS, 100 tons, addition to Melbourne Hotel, to Missouri Rolling Mill Corporation.

OAKLAND, CAL., 350 tons, Sears, Roebuck & Co. building, to Soule Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

AUGUSTA, ME., 300 tons for State Highway Commission.

WORCESTER, MASS., 200 tons, shoe plant addition.

CAMBRIDGE, MASS., 125 tons, hospital addition.

NEW YORK, 225 tons, power house at Hunter College.

CALDWELL, N. J., 240 tons, St. Dominick's Academy.

HOBOKEN, N. J., 1000 tons, additional unit for Pennsylvania Terminal & Warehouse Co.

NEWARK, N. J., 600 tons, warehouse for Lehigh Valley Transportation Co.

BUFFALO, 175 tons, rail steel for school No. 67.

LIMA, OHIO, 100 tons, depot.

CHICAGO, 200 tons, public school.

CHICAGO, tonnage being estimated, Chicago Yacht Club building in Grant Park.

CHICAGO, tonnage not stated, hotel at Wabash Avenue and Harrison Street.

SEATTLE, 200 tons, Fourteenth Avenue South bridge; general contract to Puget Sound Bridge & Dredging Co.

SACRAMENTO, CAL., 306 tons, highway work in Los Angeles County; bids Dec. 18.

Foundrymen's Non-Ferrous Shop Operation Course

A non-ferrous shop operation course for brass foundrymen, along the lines given in recent years for gray iron foundrymen, is part of the program for the next convention of the American Foundrymen's Association in Cleveland the week of May 12, 1930. The subjects to be dealt with will include crucible, open fire, and electric furnace melting practice, as well as the subject of gating and the effect of pouring temperatures and pouring practice. The course will be held at 4 p. m. during the days of the convention and each subject will be in charge of a leader who is an authority in each particular field. The chairman of the course is W. F. Graham, Ohio Brass Co., Mansfield, Ohio.

Distributing Employment at Youngstown

Part Time to Operating Men, While Extensive Repair Work Aids Others

STEEL companies at Youngstown are making every possible effort to distribute employment among as large a number of men as is feasible. In a period of restrained buying and operations, such as now exists, millwrights, electricians and repair crews are kept busy putting equipment in readiness for broader operations later on. This is requiring extra work at present because of the heavy strain upon rolling mills during the first eight months of the year.

Workers engaged in actual production are also provided for as much as possible. Where a mill operates only one shift, workers on all three shifts are given equal time. For example, on a rolling mill operating only the day shift, workers on the other two shifts divide the time with the day men. Thus, in a six-day week, each receives employment two days a week, whereas the day shift worker would receive six days' work and the men on the other shifts none, unless such a plan were used. Department heads and foremen in the plants are advised to distribute work so that the largest number of men benefit.

Frank Purnell President of Sheet and Tube Company

Directors of the Youngstown Sheet & Tube Co. on Tuesday elected Frank Purnell president, succeeding James A. Campbell, who becomes a chairman of the board, a newly created position. Since Jan. 1, 1927, Mr. Purnell has been assistant president and during the last few years has gradually assumed many of the responsibilities which formerly devolved upon Mr. Campbell. The changes become effective Jan. 1, 1930.

FRANK PURNELL

The directors also appropriated $2,000,000 for modernizations and replacements, chiefly in the Youngstown district, these sums to be expended in 1930. Regular dividends were declared.

Mr. Campbell, as chairman of the board, will continue to have general direction of the affairs of the company. Mr. Purnell is now 43 years of age and is one of the youngest steel company executives in the country. In 1902 he began his career in the industry, starting as a hall boy for the Sheet & Tube company. In August, 1917, he was "loaned" to the War Industries Board, and in 1919 became vice-president of the Consolidated Steel Corporation, New York, export representative of independent steel companies. In 1922 he was made vice-president of the Bethlehem Steel Corporation, in charge of its export department. He returned to the Sheet & Tube organization in September, 1923, as a vice-president, and on Jan. 1, 1927, was made assistant president.

Address Heat Treaters on Economics

"Economics of Heat Treating" will be the subject of Robert M. Keeney at the meeting of the New York Chapter of the American Society for Steel Treating, Monday evening, Dec. 9. Mr. Keeney is connected with the Connecticut Light & Power Co., Hartford and he has made a broad study of the application of various kinds of fuel besides electricity in the heat treatment of ferrous and non-ferrous products. The meeting will be held in the club rooms of the Building Trades Employers' Association, 2 Park Avenue, New York, and will be preceded by a dinner at the same place at 6.30.

The January meeting of the chapter will be held on Monday evening, Jan. 13, at which Dr. H. W. Gillett, director Battelle Memorial Institute, Columbus, Ohio, will be the speaker.

Steel Treaters Hear More About Nitriding

Nitriding, the new art of surface hardening of steel, featured the November meetings of three chapters of the American Society for Steel Treating. On Nov. 22 members of the Philadelphia, St. Louis and Washington-Baltimore Chapters met in separate meetings to learn more about nitriding from experts on the subject.

In Philadelphia, V. T. Malcolm of the Chapman Valve Mfg. Co., Indian Orchard, Mass., explained the commercial application of nitriding, in which he has gained considerable experience. Also on the Philadelphia program was John Hirsch, research metallurgist, Leeds & Northrup Co., Philadelphia. Mr. Hirsch's talk on "Controlling the Nitriding Operation," described the furnace mechanism which the speaker had adapted for the nitriding process.

Robert Sergeson, metallurgist with the Central Alloy Steel Corporation, Canton, Ohio, was the featured speaker at the St. Louis meeting. In a talk, illustrated with slides, Mr. Sergeson gave a survey of the accomplishments in the nitriding of steel and described the process.

Members of the Washington-Baltimore chapter met in Baltimore to hear Dr. Victor O. Homerberg, professor of metallurgy, Massachusetts Institute of Technology. Dr. Homerberg gave special emphasis to the practical aspects and use of nitriding.

Philadelphia Metal Jobbers to Merge Dec. 31

Carter, Donlevy & Co., Gummey, McFarland & Co., and Riter Brothers & Co., wholesale sheet metal distributers of Philadelphia, will be succeeded on Dec. 31 by a new organization to be known as the Eastern Metals Corporation.

The new company will be located in a commodious warehouse at 1736 to 1746 Frankford Avenue, with railroad siding, and all modern facilities. Large and diversified stocks of tin plate, metals, tools, machines and supplies will be carried.

Tin Plate Company Bought By Corrigan-McKinney

The N. & G. Taylor Co., Philadelphia, one of the oldest makers of tin plate in the United States, has been acquired by the Corrigan-McKinney Steel Co., Cleveland. For the past year and a half, William McLean, president, N. & G. Taylor Co., has been in charge, operating it for the creditors. Under the terms of the sale, the Corrigan-McKinney company will pay $300,000 for the plant and other assets and will incorporate a new company with the same name, which will issue 3000 shares of first preferred stock and 3250 shares of second preferred stock of $100 par value and 3500 shares of common stock of no par value. The stock and cash will be used to pay the obligations of the company.

The Taylor company has been in business since 1810, and until a year and a half ago, when financial difficulties were encountered, operated its main plant at Cumberland, Md., and a small plant in Philadelphia. At that time the Philadelphia plant was dismantled and removed to Cumberland, bringing the annual capacity of that mill to about 710,000 base boxes of tin plate. Present officers of the N. & G. Taylor Co. are William McLean, president, and J. H. Krupp, secretary and treasurer. Incorporation of the new company has not yet been completed.

Non-Ferrous Metal Markets

Copper Steady at 18c. But Buyers Wait for Concessions —Tin Dull—Zinc Price Down

NEW YORK, Dec. 3.

Copper.—Little has occurred in the past week to encourage producers. Buyers, especially in the foreign market, are continuing to press for a reduction in prices, but there is no indication that any substantial amount of electrolytic copper is available under 18c., delivered in the Connecticut Valley. In fact, the comparatively small tonnages which were offered at concessions in the past two weeks have been contracted for by those customers who were persistently hunting bargain lots and little, if any, material can now be obtained at less than 18c. However, the report has spread that after Jan. 1 the price will be cut by the large producers and consequently copper users are holding off making purchases until they see what happens. It is not surprising, under the circumstances, that sales have been meager and have consisted solely of small lots for delivery this month. Producers disclaim knowledge of a contemplated drop in quotations and declare that they can sell just as much copper at 18c. as at a lesser figure. The abstinence from buying on the part of foreign users is thought to have diminished their stocks almost to the vanishing point, so that they soon will be forced to place orders to cover immediate requirements. A comparable situation, however, does not exist in the domestic trade, because most customers have considerable material on hand and can well afford to await developments before making future commitments. November statistics are expected to show an increase in refined stocks, and this will tend to further weaken the position of producers. Curtailment of output, designed chiefly to correct the over-balance of supply as against demand, has been started, but probably will not be reflected in the monthly figures until January. Copper Exporters, Inc., is still quoting 18.30c., c.i.f. usual European ports. Orders for Lake copper have been light, with quotations steady at 18c. to 18.12½c., delivered.

Copper Averages.—The average price of Lake copper for November, based on daily quotations in THE IRON AGE, is 18.12½c., delivered New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—With total sales scarcely ex-

THE WEEK'S PRICES, CENTS PER POUND FOR EARLY DELIVERY

	Dec. 3	Dec. 2	Nov. 30	Nov. 29	Nov. 27
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½

Rolled Products
List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over.

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.50c.
- Lead (full sheets) ..... 10.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

	Base per Lb.

Brass	26.00c.	to 27.00c.
Copper	29.12½c.	to 30.12½c.
Brass Rods	18.87½c.	to 19.87½c.
Brazed Brass Tubes	29.12½c.	to 30.12½c.

New York Warehouse

Delivered Prices, Base Per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.75c. to 11.25c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 41.50c. to 42.50c.
- Tin, bar ..... 43.50c. to 44.50c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.00c. to 7.50c.
- Lead, American pig ..... 7.00c. to 7.50c.
- Lead, bar ..... 9.00c. to 9.50c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 27.50c. to 28.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 45.50c.
- Tin, bar 47.50c
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 8.00c. to 8.25c.
- Lead, American pig ..... 7.00c. to 7.20c.
- Lead, bar ..... 9.25c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.00c.
- Babbitt metal, high grade ..... 48.00c.
- Solder, ½ and ½ ..... 29.50c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.00c.
Copper, hvy. and wire	14.50c.	15.50c.
Copper, light and bottoms	12.50c.	13.50c.
Brass, heavy	8.00c.	9.00c.
Brass, light	6.75c.	7.75c.
Hvy. machine composition	11.25c.	12.25c.
No. 1 yel. brass turnings	9.00c.	9.50c.
No. 1 red brass or compos. turnings	10.50c.	11.75c.

Zinc	3.25c.	3.75c.
Sheet aluminum	12.00c.	13.50c.
Cast aluminum	11.00c.	13.00c.

ceeding 700 tons, the Straits tin market has been exceptionally quiet in the past week. Buying has been mostly for delivery during the next three months, although a small amount of material is for March and April shipment. The London market has been very erratic, with wide swings in prices. For example, on Nov. 28 (Thanksgiving Day, when the New York market was closed) spot standard was £176 10s., future standard £179 10s. and spot Straits £180 10s. The following day the price advanced £3 5s. and on Dec. 2 dropped back £5 10s. Today there was another recovery, with spot standard at £177 15s., future standard at £180 15s. and spot Straits at £181 15s. The Singapore schedule today was £178 15s. Spot Straits tin at New York declined steadily during the past week until today it turned slightly upward to 39.37½c., New York. The reason that the London market broke yesterday was the announcement of the estimate of Straits tin shipments of 11,000 tons in December with 14,000 tons available. This is in addition to shipments of 10,174 tons in November, making altogether a large tonnage of tin to be absorbed by consumers. Usually at this time of the year, when tin plate prices are made public for the first half of the following year, there is good buying of tin, but the volume of purchases has been far below that of previous years. Dealers surmise that tin plate manufacturers have either liberal stocks on hand or are postponing placing orders to ascertain the trend of business.

Lead.—The market has been fairly active, with users ordering small quantities for delivery in December. In a few instances, business is being booked for January, but some sellers are refusing to make contracts for shipment after Dec. 31. Prices are firm at 6.10c., St. Louis. The leading interest is adhering to its contract quotation of 6.25c., New York.

Zinc.—Zinc prices broke the past week, dropping from 6.25c., East St. Louis, to 6.15c. and later to 6c. At times quotations dipped to 5.95c. and some orders were taken at that price. However, most of the tonnage available under 6c. has been sold and the market is becoming stabilized at 6c., East St. Louis, or 6.35c., New York. Buyers have manifested only slight interest, preferring to order small lots to meet immediate needs.

Antimony.—Quietness prevails in antimony. Chinese metal for spot and future delivery is 8.62½c., New York, duty paid, the same as a week ago.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. a lb., shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is selling at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 26.—Prices of copper, lead and antimony are holding steady in a quiet market. Quotations for tin are 3c. a lb. lower than a week ago and zinc prices also are off. The old metal market is dull.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 39.75c.; lead, 6.10c.; zinc, 6.10c.; in less-than-carload lots, antimony, 9.50c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 22c.; block tin, 32c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Awards, at 12,000 Tons, Are Lowest of Year—Chicago Post Office Will Require 25,000 Tons

THE total volume of fabricated structural steel awards in the past week was the lowest of the year, amounting to 12,000 tons. Most of the lettings consisted of small jobs ranging from 100 to 500 tons each. Of the 47,000 tons of new work which came out during the week, over 29,000 tons will be required for three projects in Chicago. The new Chicago post office will take 25,000 tons. Awards follow:

BOSTON & MAINE RAILROAD, 1000 tons, bridge at Windsor, Vt., to American Bridge Co.

PROVIDENCE, R. I., 250 tons, United States Rubber Co. vulcanizing plant, to J. H. Tower Iron Works, Providence.

NEW YORK, 950 tons, public school No. 102 in Bronx, to Easton Structural Steel Co.

NEW YORK, 1425 tons, apartment at Eighty-sixth Street and Madison Avenue, to Hay Foundry & Iron Works.

BROOKLYN, 300 tons, Kings County Bank, to George A. Just Co.

NEWARK, N. J., 1800 tons, garage, to American Bridge Co.

JERSEY CITY, 370 tons, Pennsylvania Terminal warehouse, to Bethlehem Steel Co.

SOUTHERN RAILWAY, 500 tons, Savannah River bridge, to Virginia Bridge & Iron Co.

DURHAM, N. C., 400 tons, S. H. Kress Co. store, to Ingalls Iron Works.

PITTSBURGH, 200 tons, addition to Boulevard of Allies, to Guibert Steel Co.

DETROIT, 200 tons, Richard School, to Guibert Steel Co.

CLEVELAND, 700 tons, Kinsman Road bridge for Nickel Plate Railroad, to McClintic-Marshall Co.

CLEVELAND, 100 tons, Dudley Blossom swimming pool, to Wheeling Structural Steel Co.

CHICAGO, BURLINGTON & QUINCY, 600 tons, divided between American Bridge Co. and Paxton & Vierling Steel Works, Omaha.

WHEATLAND, WYO., 300 tons, sugar refinery, to Midwest Steel & Iron Works Co., Denver.

GOSHEN, IND., 100 tons, factory for Chase Bag Co., New York, to Austin Co.

KEWAUNEE, WIS., 500 tons, highway bridge, to Milwaukee Bridge Co.

SEATTLE, WASH., 370 tons plates, Cedar River pipe line No. 2, to Beall Tank & Pipe Co.

BAKERSFIELD, CAL., 300 tons plates, one 85,000-bbl. tank for Petroleum Securities Co., to unnamed bidder.

OAKLAND, CAL., 100 tons, skating rink, to Judson-Pacific Co.

SACRAMENTO, CAL., 273 tons, crossing at California Park, to Dyer Brothers.

LOS ANGELES, 500 tons, plant for Pacific Iron & Steel Co., company to do its own fabricating.

LOS ANGELES, 430 tons, freight depot, Union Pacific Railroad Co., to Minneapolis Moline Power Implement Co.

PHOENIX, ARIZ., 172 tons, bridges on Holbrook-Lupton highway, to Kansas City Structural Steel Co.

WILMINGTON, CAL., 110 tons, condenser supports for Texaco, to Pacific Iron & Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 1000 tons, Central Hanover Bank & Trust Co. building on Greenwich Street.

NEW YORK, 1500 tons, apartment building on West Sixty-sixth Street.

LANCASTER, PA., 500 tons, telephone exchange building; Central Construction Co., Harrisburg, Pa., general contractor.

RICHMOND, VA., 2500 tons, building for American Tobacco Co.; Wise-Granite Co., Richmond, general contractor.

PHILADELPHIA, 2600 tons, Eighth Street subway from Ridge Avenue to Walnut Street.

STATE OF NEW YORK, 500 tons, bridges for State highway department; bids taken Dec. 6.

EASTON, PA., 750 tons, building for Lehigh Telephone Co., John N. Gill, Philadelphia, general contractor.

PARKERSBURG, W. VA., 1000 tons, building for Viscose Co.

TOLEDO, OHIO, 1000 tons, building for Toledo University.

ROCK ISLAND, ILL., 1800 tons, 20 barges; bids being taken by United States Engineer, Rock Island.

SPRINGFIELD, ILL., 300 tons, addition to Monarch Tractor plant of Allis-Chalmers Mfg. Co.

CHICAGO, 25,000 tons, post office.

CHICAGO, 2500 tons, Wabash Avenue bridge.

CHICAGO, 1800 tons, Chicago Yacht Club building in Grant Park.

DENNISON, TEX., 950 tons, highway bridge; L. E. Meyer Construction Co., low bidder on general contract.

TERRAL, OKLA., 1150 tons, highway bridge; L. E. Meyer Construction Co., low bidder on general contract.

THACKERVILLE, OKLA., 1150 tons, highway bridge; L. E. Meyer Construction Co., low bidder on general contract.

SEATTLE, 1000 tons, Fourteenth Avenue South bridge; general contract to Puget Sound Bridge & Dredging Co.

LONG BEACH, CAL., 400 tons sheet piling; Steel, Inc., low bidder.

Rustless Iron Plant To Be Built at Pittsburgh

The Rustless Iron Corporation of America, Inc., Baltimore, has engaged Perin & Marshall, 11 West Forty-second Street, New York, consulting engineers, to prepare plans for a new mill in the vicinity of Pittsburgh.

PERSONAL

CHARLES M. SCHWAB, chairman of the board of directors of the Bethlehem Steel Corporation, will be the principal speaker at the annual banquet of the Indiana Manufacturers' Association, Dec. 16, at the Columbia Club, Indianapolis.

—

HAROLD D. NORTH, vice-president and sales manager, Ferry Cap & Set Screw Co., Cleveland, has developed an international business in the manufacture of a projection screen for motion pictures which utilizes as the base an aluminum sheet.

—

R. W. HEFFNER has been elected vice-president in charge of operations of the Alan Wood Mining Co., not R. S. Poister, as stated in the Nov. 28 issue of THE IRON AGE.

—

E. W. PAGE, Victor X-Ray Corporation, Chicago, will address the Milwaukee chapter of the American Society for Steel Treating, Dec. 13, at Hotel Pfister, on "X-Ray Investigations."

—

B. D. QUARRIE, president, Oliver Iron & Steel Co., Pittsburgh, will act as toastmaster at a dinner and reception to be given at the Winton Hotel, Cleveland, Dec. 16, for Dr. WILLIAM E. WICKENDEN, new president Case School of Applied Science. Dr. Wickenden will speak on training engineers for positions of responsibility. The meeting will be held jointly by the Cleveland Engineering Society and the Cleveland section American Society of Mechanical Engineers.

—

T. M. GIRDLER, formerly president Jones & Laughlin Steel Corporation, Pittsburgh, and now associated with the Mather-Eaton steel interests in Cleveland, has been elected a director of the Union Trust Co. of that city.

—

CHARLES STOLPER, president and treasurer, Stolper Steel Products Co., Milwaukee, manufacturer of sheet steel automotive parts, has relinquished all of his interest in the Charles Stolper Cooperage Co., to devote his time to the steel products lines, which comprise gasoline tanks, fenders, and similar parts.

—

R. SERGESON, metallurgist, Central Alloy Steel Corporation, Massillon, Ohio, addressed the Milwaukee section of the Society of Automotive Engineers, Dec. 4, on nitriding and other methods of hardening steel.

—

HUGH AIKMAN of J. H. Williams & Co., Buffalo, will address the Cincinnati chapter of the American Society for Steel Treating, Dec. 5, on "Drop Forging Methods and Equipment."

—

J. E. FLETCHER, who has had a long experience with the Northern Engineering Works, Detroit, has been appointed manager of the newly established Philadelphia office of the company.

—

C. E. PIOCH, formerly general master mechanic of the Chrysler Motor Corporation, has joined the staff of the Seneca Falls Machine Co., Seneca Falls, N. Y.

—

JAMES A. MEACHAM, for the past three years specification engineer for the H. K. Ferguson Co., Cleveland, has been made engineer in charge of inspection and research.

—

J. T. MACKENZIE, metallurgist, American Cast Iron Pipe Co., Birmingham, was the principal speaker at the December meeting of the Quad-City Foundrymen's Association, held at the Chamber of Commerce, Davenport, Iowa, Dec. 2. Foundry practice was the subject of his address.

—

HARRY R. NELSON, who has been associated with the Charles L. Anderson Machinery Co., Chicago, for the past 16 years, has joined the staff of the Tool Equipment Sales Co., Chicago, as mechanical engineer.

—

GEORGE W. DRIVER, heretofore assistant manager of the malleable plant at Buffalo of the American Radiator Co., has been promoted to the managership of the company's malleable and steel plants at Buffalo.

—

WILLIAM HAGUE of the Arter Grinding Co., Worcester, Mass., spoke on "European Steel Plants and Allied Industries," Dec. 4, at a meeting of the Worcester chapter of the American Society for Steel Treating.

Floyd K. Smith Elected Head of Donner Steel Co.

Floyd K. Smith, former vice-president and treasurer of the Donner Steel Co., has been elected president, succeeding William H. Donner, who recently resigned. Mr. Smith, who was born at Bayonne, N. J., studied at Cornell University and entered the steel business with the Buhl Steel Co. of Ohio. He became sales manager of the Buhl company and went from there to the Republic Iron & Steel Co. as a district sales manager. He later became a partner in Banning, Cooper & Co., Pittsburgh, brokers, and in 1910 acquired an interest in the Valley Mold & Iron Co., Sharpsville, Pa. He remained there until 1917, when he went with the Donner Steel Co. as vice-president and treasurer.

F. K. SMITH

W. W. HANCOCK

W. W. Hancock, secretary and director of the Donner Steel Co., has been elected vice-president. Mr. Hancock attended the University of Michigan and was later associated with William H. Donner at Donora, Pa. From 1912 to 1916 he was with the Cambria Steel Co. and in 1916 became a director and secretary of the Donner Steel Co. His duties included supervision of the iron ore department. During the war he was in the flying service as a flight lieutenant and instructor.

P. F. Boyer, comptroller of the Donner Steel Co., has been named treasurer, assuming the duties of this position along with the comptrollership. Mr. Boyer entered the steel business with the American Bridge Co. in 1907 and remained there until 1916, when he became associated with the Donner Steel Co.

The Danly Machine Specialties Co., 2104 South Fifty-second Avenue, Chicago, has been appointed by the Kinite Corporation, Milwaukee, as selling representative for the Chicago district, which includes Illinois, Missouri, upper Indiana and Iowa. The Danly Machine Specialties Co. will handle the sales of Kinite cast-to-shape dies as well as Kinite bar stock.

OBITUARY

CHARLES F. BLUE, JR., for a number of years vice-president of the Carbon Steel Co., Pittsburgh, and during the dissolution of that company in 1923 its head, died at his home in Oakmont, Pa., Nov. 26. Prior to joining the Carbon Steel Co. in 1916, Mr. Blue had been associated with the Crucible Steel Co. of America as manager of its Detroit office. With the completion of the dissolution of the Carbon Steel Co., he became associated with the Pittsburgh Iron & Steel Foundries Co. as vice-president and plant manager.

—

ERIC WOLFF, designer of power and pumping plants and sales engineer with the Allis-Chalmers Mfg. Co., Milwaukee, for 17 years, and previously an engineer with the Minneapolis Steel & Machinery Co., Minneapolis, died in Milwaukee, Nov. 24, as a result of heart trouble, aged 63 years. He was born in Sweden and had engaged in engineering work since his arrival in the United States 30 years ago.

PETER C. QUACKENBUSH, president, Quackenbush & Son, Inc., dealer in iron and steel and heavy hardware, Paterson, N. J., died at his home in that city on Nov. 28, following a long illness, aged 61 years.

—

FREDERICK G. LYNN, general superintendent of the Wood Newspaper Machinery Corporation, Plainfield, N. J., died on Oct. 29. He had also been general superintendent of the Plainfield plant of the Niles, Bement, Pond Co. for many years.

—

JAMES W. MOFFAT, Canadian metallurgist, died at his home in Toronto, on Oct. 28, aged 69 years. At the time of his death he was engaged in research on a process which would be suitable for smelting Ontario ores.

—

J. H. HOLLINGER, representative in Philadelphia of the Landis Tool Co., Waynesboro, Pa., died Nov. 18, aged 61 years. He had been connected with the Landis company for 32 years, most of the time at the plant in Waynesboro.

Confidence Restored Says President

(*Concluded from page* 1531)

dent Hoover explained. "Over 6400 planes are in commercial use, and 9400 pilots are licensed by the Government. Our manufacturing capacity has risen to 7500 planes per annum. The aviation companies have increased regular air transportation until it now totals 90,000 miles per day—one-fourth of which is flown by night. Mail and express services for passenger transportation to our principal cities, and extensive services for passenger transportation have been inaugurated, and others of importance are imminent. American air lines now reach into Canada and Mexico, to Cuba, Porto Rico, Central America, and most of the important countries of South America."

Stimulation of Shipbuilding

Construction loans for the building of ships have been made by the Shipping Board to the amount of approximately $75,000,000 out of the revolving fund authorized by Congress, the President said, and have furnished an additional aid to American shipping and further stimulated the building of vessels in American yards. It was stated that the Interdepartmental Committee on the Merchant Marine in its studies of ocean mail contracts found that they have aggregated 25 awards imposing a governmental obligation of a little over $12,000,000 per annum. Provision had been made in five of the contracts for construction of new vessels to replace and expand services. These requirements, the President said, come to a total of 12 vessels in the 10-year period, aggregating 122,000 tons. The committee at this time, it was pointed out, is recommending the advertising of 14 additional routes, making substantial requirements for the construction of new vessels during the life of each contract recommended. A total of 40 new vessels will be required, the President said, under the contracts proposed, about half of which will be required to be built during the next three years. The capital cost of this new construction, the President informed Congress, will be approximately $250,000,000, involving approximately 460,000 gross tons. Should bidders be found who will make these undertakings, the President said, it will be necessary to recommend to Congress an increase in the authorized expenditure by the Post Office of about $5,500,000 annually. It will be most advantageous, the President declared, to grant such authority.

An inspection trip to the Lorain plant of the National Tube Co. will be made Dec. 7 by members of the Cleveland Engineering Society and the Cleveland section, Association of Iron and Steel Electrical Engineers, this trip having been arranged jointly by the two organizations.

FitzGerald Laboratories Transferred to Canada

The FitzGerald Laboratories of Niagara Falls, N. Y., are to be transferred to Sault Ste. Marie, Ontario, Canada, as a result of an arrangement reached between Robert Turnbull, of Toronto, and J. A. McPhail, vice-president, Great Lakes Power Co. Work will be started at once on the erection of a building next to that of the Superior Alloys, Ltd., in which Mr. Turnbull is also interested. It will be ready for operation within a few months.

One of the most important problems to be tackled by the laboratory will be the making of the final tests in connection with the Turnbull process for the reduction of iron ore to sponge iron, which it is expected will make the low-grade iron ores of this province commercially available. For this purpose a furnace of semi-commercial size will be built in connection with the laboratories and the tests will be taken up at the point where they were interrupted by the recent death of F. A. J. FitzGerald, director of the laboratory and associate of Mr. Turnbull in several electrometallurgical enterprises. The new furnace will be utilized to work out refinements in the process, gather additional data as to costs, and so on. Algoma iron ore will be utilized.

A new company, to be known as the FitzGerald Laboratories of Canada, Ltd., will be formed, with Mr. Turnbull, James Kelleher, Niagara Falls, an associate of Mr. Fitzgerald, F. E. Kreusi, Chicago, and J. A. McPhail and A. E. Pickering, Sault Ste. Marie, as directors. Mr. Kelleher will be in charge, acting also as manager of the Superior Alloys, Ltd.

It is expected that the establishment of the laboratory here will lead to other electrochemical and metallurgical industries selecting this as a site for their operations The Sault was chosen partly because of the expected development of the iron and steel industry there and the existence of good shipping facilities and also the fact that the Great Lakes Power Co. agreed to take a substantial financial interest in the project.

To Improve Stove Operation

The Gary plant of the Illinois Steel Co. has made preparations to use fine, cleaned blast furnace gas in four high-efficiency hot blast stoves. Six disintegrators and eliminators, two washing towers, and the checker construction for four hot blast stoves have been purchased from H. A. Brassert & Co., Chicago.

The stoves embody the principles of continuous checker openings from top to bottom in vertical alinement, which permits inspection and gives effective heat transfer by gas and air traveling at equalized velocities through graduated checker openings.

Machinery Exports Far Above Last Year

Ten-Month Total Up 26 Per Cent to a New High Record—Imports Up Nearly One-Half Over 1928

WASHINGTON, Nov. 29.—Making an upturn of $6,203,857, exports of machinery of all kinds in October rose to a value of $53,188,403 from $46,984,546 in September. For the first 10 months they aggregated $515,597,664, an increase of $107,046,573, or 26 per cent, over the corresponding period of 1928, with a value of $408,551,091. A new high record for 10 months has been made, last year having had the previous record. Never before has a full calendar year reached so high a figure as $500,000,000. Exports for October of last year were valued at $43,208,872.

Exports of machinery and vehicles in October were valued at $90,053,421, a gain of $4,738,830 over those in September, valued at $85,314,591, but a decline of $4,753,616 from similar exports in October of last year, valued at $94,817,037. For the 10 months, however, exports of machinery and vehicles reached a total value of $1,045,129,849, reflecting an increase of $183,530,800, or 21½ per cent, over those in the corresponding period last year, valued at $861,599,049.

Exports of industrial machinery, as classified by the Division of Statistics, Department of Commerce, were valued at $24,090,870, an increase of $936,001 over those in September, valued at $23,248,731, and a gain of $4,029,088 over those in October of last year. For the first 10 months they were valued at $234,373,549, an increase of $51,286,565 over the like period of 1928, valued at $183,086,984.

Total exports of power-driven metal-working machinery in October were valued at $2,718,610, compared with $2,490,918 in October of last year. For the first 10 months they were valued at $27,869,772, compared with $21,508,167 in the corresponding period of last year. Exports of metal-working machinery, as listed in THE IRON AGE table, included 973 units, valued at $1,386,312, against 944, valued at $1,595,716, in September.

Imports of machinery and vehicles in October were valued at $3,636,532, compared with $3,115,744 in September and with $2,732,255 in October of last year. They made a sharp gain to $36,141,739 in the 10 months, against $23,927,027 in the corresponding period of last year. Imports of industrial, office and printing machinery in October were valued at $2,544,436, compared with $1,985,300 in September and $1,709,793 in October of last year. For the first 10 months of 1929 they were valued at $21,192,588, an increase of $6,261,183 over the same period of last year, at $14,931,405.

Imports of machinery, as listed in THE IRON AGE table, were valued at $2,648,455 in October, compared with $2,138,908 in September and with $2,161,169 in October of last year. For the 10 months they were valued at $27,421,980, an increase of $9,045,341, or 49 per cent, over those for the corresponding period of last year, valued at $18,376,639.

A striking feature of the October imports was the heavy increase in incoming shipments of metal-working machine tools, which rose to a value of $300,269, against $95,200 in September and only $34,552 in October of last year. For the first 10 months. imports of metal-working machine tools increased sharply to $1,204,679.

Britain Absorbing Own Pig Iron Output

Continent Looking to Cartel Agreements—Japan to Buy Semi-Finished Steel—Export Rebates for Germany Are Higher

(*By Cable*)

LONDON, ENGLAND, Dec. 2.

THE bank rate reduction has induced pig iron consumers to operate rather more freely, although the market is generally inclined toward seasonal quietness and but little revival is expected before the new year. Cleveland makers are relying entirely on domestic business, as export orders are difficult to obtain. Current output, however, is being fully absorbed.

Hematite producers are well situated and obtaining more remunerative prices from domestic users, but export business is declining.

Finished steel is quiet and producers of heavy material, especially mills rolling for export and plate mills, are in need of orders. Domestic buying is fairly active, but insufficient to satisfy all makers.

Tin plate inquiry continues, but business is dull as a result of the slump in the tin market. Makers are well sold and not pressing for orders. Galvanized sheets are dull and prices easier with reduced production costs. Japan is buying moderately of light gage black sheets.

Clyde shipbuilding in November was nine vessels of 18,700 tons.

The Central Argentine Railway has placed orders for upward of 2000 passenger and freight vehicles with British builders.

Allen West & Co., electrical gear manufacturers, are negotiating for purchase from the Government of the Southampton Rolling Mills, erected for munitions production at a cost of more than £1,000,000, and idle since the end of the war.

Continental markets are awaiting the result of the International Steel Cartel meeting on Tuesday. Cartel members have already agreed to a minimum price on merchant steel bars for export of £5 5s. per ton (1.13c. per lb.), f.o.b. port, and agreements are expected on minimum prices for other finished materials. Meanwhile, the market is quiet, with semi-finished steel prices easy.

Luxemburg production in October was 259,000 tons of pig iron and 242,000 tons of raw steel. The Saar output in October was 179,000 tons of pig iron and 199,000 tons of raw steel.

German Export Rebates Increased

(*By Radiogram*)

BERLIN, GERMANY, Dec. 2.

DOMESTIC steel prices are unchanged, although the market shows a tendency to weakness and export prices have receded.

The Ingot Steel Syndicate has increased its price rebates to exporting manufacturers for the month of December, as the International Steel Cartel's recent reduction of 10 per cent in the production quota of members attained only temporary success in advancing prices.

At the coming meeting of the cartel the practicability of fixing minimum export prices for all member countries will be considered. It is confidently expected that both the International Steel Cartel and the German domestic syndicates will be renewed.

German output of pig iron and steel continues at one of the highest post-war levels, but domestic buying is slack and in export only the Scandinavian countries are buying heavily.

American Used Machinery Stocks in Germany

HAMBURG, GERMANY, Nov. 18.—Certain American exporters of used machinery have selected Frankfort-am-Main as a distributing point for equipment sold to Continental users. Sizable stocks of used metal-working machinery, motors, etc., have been collected at Frankfort for sale to users in Italy, Switzerland, France and Poland.

Japan to Buy Crude Steel

HAMBURG, GERMANY, Nov. 18.—Recently some substantial inquiries for semi-finished steel, especially billets and sheet bars, have been received here from Japan. Cabled inquiries in the past week have called for a total of more than 40,000 tons, but Japanese buyers are slow to place business. Wire rod inquiries from Japan are large.

Machinery Markets and News of the Works

Month's Tool Sales Normal

Sentiment in the New York Machinery Trade Is Decidedly More Cheerful

ALTHOUGH machine tool buyers are showing an increasing conservatism in placing orders, November turned out to be about normal as business is measured at the end of the year.

Comparing it with the corresponding month of previous years, November established a favorable sales record; it suffers only when it is put alongside the high records of earlier months of the year.

Sentiment in the machinery trade in the New York district is decidedly more cheerful, a gain in both orders and inquiries being responsible for the feeling of optimism. In some centers throughout the country, however, a slow but steady recession in business has been interpreted as a forerunner of light business in December, a month which ordinarily is affected by a seasonal lull and by the end-of-the-year inventory period.

Deliveries on some lines of tools have shortened, but only in a few cases are builders able to promise shipment this month. Moreover, numerous plants still have enough unfilled orders to carry operations along at a satisfactory rate for at least the next 60 days.

Among the past week's tool buyers were the Standard Underground Cable Co., the Western Electric Co., the New York Central Railroad, a New Jersey printing press manufacturer, the Westinghouse company and the Thew Shovel Co., Lorain, Ohio. The United Engineering & Foundry Co., Pittsburgh, which is enlarging its Canton, Ohio, plant, has purchased four large turret lathes from a Cleveland company.

Users which recently have put out inquiries for tools include the United States Aluminum Co., Goodyear Tire & Rubber Co., the Illinois Steel Co., the Chicago & North Western, an independent steel maker and the Chicago, St. Paul, Minneapolis & Omaha.

New York

NEW YORK, Dec. 3.—Sentiment in the local machinery trade is decidedly more cheerful. Not only were orders slightly better in the past week than in the week before, but machine tool sellers received a considerable number of inquiries, and investigation of these established the fact that in practically all instances early purchases may be expected. It is pointed out that machine tool business is still very good; it suffers only by comparison with some of the high monthly records of earlier months of the year. November orders compared very favorably with the same month in other years. Deliveries have shortened on some lines of tools, but only in a few cases are shipments earlier than January being promised. Among the buyers of the week were the Standard Underground Cable Co., the Western Electric Co., the New York Central Railroad and a New Jersey printing press manufacturer.

Edwards & Co., 140th Street and Exterior Avenue, New York, manufacturer of time recording instruments, fire alarm apparatus, etc., has awarded general contract to Barney Ahlers Construction Corporation, 110 West Fortieth Street, for three-story addition, to cost about $80,000 with equipment.

Slee & Bryson, 160 Montague Street, Brooklyn, architects, will soon take bids on general contract for multi-story automobile service, repair and garage building, to cost more than $175,000 with equipment.

International Paper Co., 100 East Forty-second Street, New York, is acquiring property at Chatham, N. B., as site for new newsprint mill on which work will begin next year. Initial unit will have output of about 100 tons per day and will cost more than $2,500,000.

Board of Education, Tuckahoe, N. Y., plans installation of manual training equipment in new three-story high and grade school to cost about $600,000, for which bids are being asked on general contract until Dec. 10. Knappe & Morris, 171 Madison Avenue, New York, are architects.

National Biscuit Co., 85 Ninth Avenue, New York, has authorized an increase in capital from $85,000,000 to $145,000,000, part of fund to be used for expansion and improvement, including construction of additional baking plants and acquisition of existing plants.

Kohler Co., 711 Fifth Avenue, New York, manufacturer of sanitary ware, with main plant at Kohler, Wis., has awarded general contract to G. H. Fuller, Fuller Building, for six-story factory branch, storage and distributing plant at Long Island City, N. Y., to cost over $200,000 with equipment. Buchman & Kahn, 2 Park Avenue, New York, are architects.

Cities Service Co., 60 Wall Street, New York, operating electric light and power properties in different parts of country, as well as oil and gas properties, is arranging an expansion and improvement program to cost about $150,000,000, of which about $60,000,000 will be used for extensions in natural gas facilities, and close to like sum for extensions in oil properties, including pipe line construction, steamship transportation, etc.

Murray Klein, 65 Court Street, Brooklyn, architect, will soon take bids on general contract for one-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Officials of United Aircraft & Transport Corporation, 51 Pine Street, New York, have organized United Airports of California, Inc., as a subsidiary. New company will take over airports of parent organization at Burbank Field, Los Angeles, and Pratt & Whitney Field, East Hartford, Conn.; it will also establish and operate airports in other parts of country, including servicing and repair facilities for aircraft.

United Electric Light & Power Co., 130 East Fifteenth Street, New York, has plans for a one-story addition to power plant at Locust Avenue and 134th Street, to cost over $100,000 with equipment.

Federal Shipbuilding & Dry Dock Co., Kearny, N. J., will carry out expansion and improvements at shipyard on Hackensack River, to provide in part for construction of larger vessels. Two large shipways will be built, with shops and equipment-handling facilities, elevating and conveying apparatus. Two existing shipways will be enlarged and improved, and additional mechanical shops provided. Entire program will cost over $200,000.

Ford Motor Co., Detroit, has awarded general contract to Turner Construction Co., 420 Lexington Avenue, New York, for new assembling plant at Edgewater, N. J., to replace present works at Kearny, N. J., lately sold to Western Electric Co. New plant at Edgewater will consist of main two-story unit, 360 x 1500 ft., and two one-story structures, each 50 x 113 ft., to cost over $1,000,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Board of Education, 31 Green Street, Newark, will receive bids until Dec. 12 for machine shop and wood-working machinery, steel lockers and shelving, automobile shop equipment, exhaust fans, air compressors and pumps, electrical supplies, and other electrical and mechanical equipment. R. D. Argue is secretary.

M. Arthur Wolf, 845 Broad Street, Newark, architect, has plans for a three-story automobile service, repair and garage building, 160 x 200 ft., to cost about

$140,000, and will ask bids on general contract early next year.

Grasselli Chemical Co., Guardian Building, Cleveland, a subsidiary of E. I. duPont deNemours & Co., Wilmington, Del., manufacturer of industrial chemicals, etc., is considering expansion at plant at Grasselli, near Linden, N. J., to cost over $1,000,000 with machinery.

Philadelphia

PHILADELPHIA, Dec. 2.—R. D. Wood Co., 400 Chestnut Street, Philadelphia, manufacturer of hydraulic machinery and parts, automatic gas producers, etc., has taken bids on general contract for one-story machine shop, 100 x 240 ft., at plant at Florence, N. J., to cost more than $100,000 with equipment.

Shell Eastern Petroleum Products Co., Elverson Building, Philadelphia, a subsidiary of Shell Petroleum Corporation, Shell Building, St. Louis, has asked bids on general contract for new oil storage and distributing plant near Luzerne and D Streets, where tract was recently acquired, to cost about $125,000 with equipment. Plans have been filed for a pumping plant at that location, as well as for one-story automobile service and garage building. Headquarters are at 122 East Forty-second Street, New York.

Titgen-Eastwood Co., 3562 Salmon Street, Philadelphia, manufacturer of foundry equipment, has acquired one-story building, heretofore held by Quaker City Iron Works Co., and will develop as main plant. Structure has previously been occupied under lease. Quaker City company will retain building at Tioga and Edgemont Streets, adjoining, for foundry.

Crane Co., 212 South Thirteenth Street, Philadelphia, with headquarters at 836 South Michigan Avenue, Chicago, has taken bids on general contract for new factory branch and distributing plant, to cost more than $75,000 with equipment. Stearns & Woodnutt, Stephen Girard Building, are architects.

Alan Wood Mining Co., recently formed as subsidiary of Alan Wood Steel Co., Conshohocken, Pa., to operate iron ore properties at Wharton and Oxford, N. J., is arranging appropriation of more than $500,000 for extensions and improvements in properties, mill buildings and additional machinery.

Commissioner of Institutions and Agencies, State Office Building, Trenton, N. J., is asking bids until Dec. 16 for turbine-driven generators for New Jersey State Hospital at Hillsdale. William J. Ellis is commissioner.

United States Cast Iron Pipe & Foundry Co., Burlington, N. J., will soon take bids on general contract for two and three-story wing addition, 60 x 100 ft., to cost over $50,000. Ballinger Co., 105 East Twelfth Street, Philadelphia, is architect and engineer.

E. I. du Pont de Nemours & Co., Wilmington, Del., is arranging for expansion to cost about $25,000,000, including projects now under way, comprising a paper manufacturing plant for duPont Cellophane Co., at Old Hickory, Tenn.; extensions for duPont Ammonia Corporation, Belle, W. Va., and new unit for duPont Viscoloid Co., Leominster, Mass. Included in new program are additions to machine shops at Wilmington, used for manufacture of special machinery for subsidiary interests, to cost over $75,000. Work is under way on addition to experimental plant at Brandywine, Del., to cost $50,000 with equipment.

Board of Education, Chambersburg, Pa., is considering installation of manual training equipment in new two-story senior high school at Queen and Third Streets, to cost $275,000, for which bids will be asked on general contract early next year. Lawrie & Green, 821 North Third Street, Harrisburg, Pa., are architects.

Middleton-Hyde Mfg. Co., Philadelphia, recently organized by Harry C. Middleton, Jr., 324 Florist Street, and associates, is considering early operation of local plant for manufacture of hardware products. Mr. Middleton will be treasurer of company; John G. Hyde, 1432 North Seventeenth Street, will be one of company officials.

The Crane Market

MANY of the current inquiries for material handling equipment are for inventory purposes, or to obtain prices to be used in appropriations for next year. Certain companies in the market for overhead traveling cranes are delaying action until the beginning of the new year and some business in locomotive cranes is generally expected to carry over into January. The Standard Oil Co. of New Jersey, which has been inquiring for two 25-ton locomotive cranes for Bayway, N. J., has postponed purchase until the 1930 appropriation is available. The Anglo-Chilean Consolidated Nitrate Corporation, New York, in the market for a 25 and 35-ton locomotive cranes and two 5-ton cranes mounted on motor-trucks has not yet definitely decided upon the construction in Chile which would require these cranes.

Among recent purchases are:

Bethlehem Steel Co., Bethlehem, Pa., 25-ton, gasoline-driven locomotive crane for Buffalo from American Hoist & Derrick Co.

Davison Chemical Co., Baltimore, 25-ton, steam-driven locomotive crane reported purchased from Industrial-Brownhoist Corporation.

Beauharnois Light, Heat & Power Co., Montreal, two 30-ton locomotive cranes from Browning Crane Co.

Anaconda Copper Mining Co., 25 Broadway, New York, 10-ton, bucket handling gantry crane for Montana from Shaw Electric Crane Co.

Phoenix Utility Co., 71 Broadway, New York, 20-ton, 1-motor, overhead crane from Whiting Corporation.

Locomotive Finishing Material Co., Atchison, Kan., three electric overhead cranes from a Wisconsin builder.

Wyatt Co., Dallas, Tex., 15-ton overhead traveling crane from Whiting Corporation.

Mine La Motte Co., Bonne Terre, Mo., 10-ton, electric traveling crane from Manning, Maxwell & Moore, Inc.

Buffalo

BUFFALO, Dec. 2.—Officials of Sterling Range & Furnace Corporation, 524 Oak Street, and Co-Operative Foundry Co., 25 Lincoln Avenue, Rochester, N. Y., are organized new company under name of Sterling-Red Cross Corporation, to take over and consolidate both interests. New company will carry out expansion and improvement program.

Corning Glass Co., Corning, N. Y., manufacturer of special baking glassware, etc., has awarded general contract to H. K. Ferguson Co., Cleveland, for addition to plant to cost over $500,000 with equipment.

New York State Industrial School, Industry, near Buffalo, Dr. Andrew G. Johnson, superintendent, is planning construction of 14 trade school buildings at institution, each one story, for instruction in mechanical and building trades. A main unit is now in course of completion, to cost about $200,000 with equipment.

Joseph A. Firsching, Jr., 1631 Bennett Street, and Howard Brodt, 1201 Stark Street, Utica, have organized Joseph A. Firsching, Jr., Inc., and plan operation of local factory for manufacture of machinery and parts.

New York State Electric Corporation, Ithaca, N. Y., a subsidiary of Associated Gas & Electric Co., 61 Broadway, New York, is concluding arrangements for purchase of Delaware & Otsego Light & Power Co., Franklin, N. Y., and will consolidate. Plans are under way for expansion, including construction of transmission line to connect both systems.

Ogden R. Adams, Cutler Building, Buffalo, machine tool dealer, has been appointed district representative of Reisinger Machine Co., Rochester, N. Y., manufacturer of adjustable hollow mills.

New England

BOSTON, Dec. 3.—Some local machine tool dealers did an average business in November, but with the majority sales fell off. No new inquiries of importance have developed and those pending give no indication of closing until after Jan. 1. New England machine tool builders generally are active and well booked ahead.

American Brass Co., Waterbury, Conn., is taking bids on a one-story, shipping department addition, 43 x 64 ft. Conveying equipment is under consideraton.

Martin Trailer Co., Westfield, Mass., will erect a one-story plant, 80 x 100 ft., to cost $40,000 without equipment.

City of South Norwalk, Conn., closes bids Dec. 10 for a junior high school, which will include a manual training department, to cost $350,000.

Florence Stove Co., Gardner, Mass., has started work on a 30 x 90 ft. enameling furnace.

Wilcox, Crittendon & Co., Inc., Middletown, Conn., closes bids this week on a two-story foundry, 100 x 187 ft., with a one-story wing, 25 x 48 ft.

G. & O. Mfg. Co., New Haven, Conn., automobile radiators, etc., will shortly start work on a two-story and basement addition, 40 x 85 ft.

State Board of Education, Hartford, Conn., has plans for new trade school at Meriden, Conn., consisting of three-story L-shaped unit, 120 x 180 ft., with wing 60 x 60 ft. A machine shop, wood-working shop, plumbing shop and other mechanical departments will be installed. It will cost over $175,000 with equipment. Lorenzo Hamilton, Inc., Meriden, is architect.

Maine Seaboard Paper Co., recently organized by Walter S. Wyman, president, Central Maine Power Co., 317 Water Street, Augusta, Me., and associates, has authorized construction of new mill at Bucksport, Me., where property has been acquired. Plant will consist of several units and will cost more than $5,000,000. Company has also purchased about 400,000 acres of timberland in eastern part of State, and will develop for raw material supply.

Rice, Barton & Fales Co., Tainter Street, Worcester, Mass., manufacturer of paper-making machinery and parts, has awarded general contract to E. J. Cross Co., Worcester, for extensions and improvements, to cost about $25,000.

Taunton & New Bedford Copper Co., North Front Street, New Bedford, Mass., has asked bids on general contract for one and two-story addition, including improvements in present factory, to cost about $45,000 with equipment.

Superior Spring & Mfg. Co., 373 Washington Street, Hartford, Conn., will take bids at once for one and two-story addition, 60 x 128 ft., to cost about $36,000 with equipment. George L. Dunkelberger, Hartford, is architect.

Warren Foundry & Pipe Co., 201 Devonshire Street, Boston, will ask bids early next year for new pipe foundry, storage and distributing plant at Everett, Mass., to cost over $40,000 with equipment. French & Hubbard, 210 South Street, Boston, are architects.

Springfield Bronze & Aluminum Co., Page Boulevard, Springfield, Mass., has awarded general contract to Austin Co., Cleveland, for one-story addition, 82 x 142 ft., to cost about $45,000 with equipment.

Rising Paper Co., Housatonic, Mass., a subsidiary of Strathmore Paper Co., Mittineague, Mass., has plans for three-story finishing department addition, 75 x 180 ft., to cost more than $90,000 with machinery.

City Council, New Haven, Conn., has plans for municipal airport at Morris Cove, to include hangars, repair shops and other field units, to cost about $85,000 with equipment. Westcott & Mapes, 139 Orange Street, are architects and engineers.

Connecticut Broach & Machine Co., New London, Conn., has removed its manufacturing plant and offices from 376 Bank Street to 35 Pequot Avenue.

South Atlantic

BALTIMORE, Dec. 3. — Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, is arranging an expansion and improvement program to cost about $7,500,000, including extensions in generating facilities, transmission lines, underground conduits and other work. Company has plans for one-story addition to switching plant on Kloment Street, to cost about $50,000.

Eastern Rolling Mill Co., Sewer Road, Baltimore, has authorized an expansion and betterment program to cost about $325,000 with equipment, to be carried out over five months' period.

Washington Air Terminals Corporation, National Press Building, Washington, has plans for steel hangar, 100 x 135 ft., with repair and reconditioning facilities, at local airport, to cost more than $85,000 with equipment. Lockwood Greene Engineers, Inc., 100 East Forty-second Street, New York, is engineer.

Glamorgan Pipe & Foundry Co., Lynchburg, Va., has arranged for increase in capital stock for general expansion. S. M. Lloyd is president.

American Tobacco Co., Twenty-sixth and Cary Streets, Richmond, Va., has awarded general contract to Wise Granite & Construction Co., American National Bank Building, for new three and six-story factory at Richmond, 210 x 270 ft., to cost over $1,000,000, with power house, mechanical-handling, conveying and other equipment. J. E. Sirrine & Co., 215 South Main Street, Greenville, S. C., are architects and engineers.

Crown Oil & Wax Co., 200 South Eighth Street, Baltimore, will soon take bids for three-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Victory Sparkler & Specialty Co., Elkton, Md., has leased factory of Bibbs Foundry Co., Port Deposit, Md., and will remodel for new branch plant for sparkler novelties of metal and other materials.

Washington Railway & Electric Co., Fourteenth and C Streets, N. W., Washington, will take bids on general contract for two-story motor bus service, repair and garage building, to cost about $200,000 with equipment.

Weston & Brooker Co., Grand Building, Columbia, S. C., has purchased quarry properties of A. T. Small, Macon, Ga., and is reported planning expansion, including installation of quarrying and other mechanical equipment.

Public Improvement Commission, City Hall, Baltimore, is considering construction of addition to Polytechnic Institute, with vocational training facilities, to cost $1,000,000, and will develop plans in connection with 1930 school expansion and improvement program. Herbert J. Leimbach is chief engineer, in charge.

Detroit

DETROIT, Dec. 2.—Detroit Stoker Co., 1510 East First Street, Monroe, has awarded general contract to Austin Co. for one-story unit, to cost about $35,000 with equipment. R. M. Dunbar, 4 South Front Street, Monroe, is architect.

Boyer-Campbell Co., Brush and Congress Streets, Detroit, tools, factory equipment and appliances, etc., is arranging for early removal to new four-story storage and distributing plant on Antoine Street, in course of construction, where operations will be expanded.

United States Rubber Co., 6600 East Jefferson Street, Detroit, will carry out expansion program at local mill and install additional equipment, to cost about $200,000. L. D. Tompkins is general manager of tire-manufacturing department. Headquarters are at Broadway and Fifty-eighth Street, New York.

City Commission, Kalamazoo, has leased part of Lindbergh Field, where city airport is now maintained, for construction of one-story airplane service and repair works, to cost more than $45,000 with equipment.

Board of Education, Harrison and Eighth Streets, Flint, is considering installation of manual training equipment in addition to Northern high school, to cost about $500,000, for which bids will be asked on general contract next spring. Malcolmson & Higginbotham, 1219 Griswold Street, Detroit, are architects.

Traveling ovens, power equipment, conveying machinery and other mechanical equipment will be installed in new plant, 80 x 200 ft., to be erected at Detroit by General Baking Co., 420 Lexington Avenue, New York, to cost over $800,000. C. B. Comstock, 122 East Forty-second Street, New York, is architect and engineer.

Plant and business of Century Boat Co., Manistee, have been acquired by new interests, headed by John A. Hacker, Detroit, which will take immediate possession. New company will be formed, retaining Century name, with capital of $300,000, to operate plant for production of outboard motor craft. Expansion and improvements are planned.

Dow Chemical Co., Midland, manufacturer of industrial chemicals, etc., will carry out expansion and install additional equipment. Company has arranged increase in capital, part of proceeds to be used for purpose noted, to cost more than $100,000.

Board of Education, Hamtramck, is considering installation of manual training equipment in two and three-story junior high school to cost about $750,000, for which bids will be asked on general contract in about 60 days. B. C. Wetzel & Co., Dime Bank Building, Detroit, is architect.

Public Lighting Commission, 174 East Atwater Street, Detroit, has awarded general contract to Martin & Kraussman Co., 955 East Jefferson Street, for extensions and improvements in former boiler station at East Atwater and Randolph Streets, four stories, 50 x 210 ft., to convert structure for equipment storage and distributing unit, with repair division, to cost $165,000. Smith, Hinchman & Grylls, Marquette Building, are architects.

Allied Die Casting Co. of America, Detroit, manufacturer of die cast automobile parts, has been incorporated by C. Sorenson, W. Friess and C. T. Fisher, and is in operation at 7420 Melville Street.

Pittsburgh

PITTSBURGH, Dec. 3.—November machine tool sales in this district declined somewhat, as compared with October, but were considered satisfactory in view of the uncertainty of general business conditions. Purchases were confined largely to single tools, and in many cases early delivery was urged, indicating that buyers are interested in taking care only of urgent needs. New inquiry is also lighter than early in the fall, and although the list of pending tools is still large, it is no longer increasing to any marked extent and some buyers have definitely postponed purchases until after the first of the year.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has closed on the majority of tools on its fourth quarter list, but United States Aluminum Co. still has a number of items to buy on a supplementary list issued several weeks ago. Railroads are not buying as yet, but dealers hope to see a strong demand from the carriers in the near future.

Spang, Chalfant & Co., Inc., Clark Building, Pittsburgh, manufacturer of welded and seamless tubular products, has plans for extensions and improvements in plant at Etna, Pa., including electrification of works. Present isolated power plant will be discontinued. New one-story units will be built and additional machinery installed, to cost about $450,000.

Oliver Iron & Steel Corporation, 1001 Muriel Street, Pittsburgh, has plans for a one-story addition, to cost about $40,000 with equipment.

Sutton Engineering Co., Bellefonte, Pa., manufacturer of mechanical products, is considering construction of one-story machine shop, reported to cost about $45,000 with equipment. E. T. Risen is general manager.

Brockway Machine Bottle Co., Brockway, Pa., will carry out expansion at plant, including one-story additions, 90 x 160 ft., and 50 x 100 ft., to cost about $80,000 with equipment.

Blaw-Knox Co., Blawnox, Pittsburgh, has begun an expansion and betterment

program at local mill, to include installation of additional equipment, to cost about $250,000. An addition will be built to plant of Lewis Foundry & Machine Co., Groveton, recently acquired.

West Virginia Coal & Coke Co., First National Bank Building, Huntington, W. Va., is arranging for expansion at coal-mining properties at Logan, W. Va., including construction of new steel tipple at Mine 45, installation of conveying, dumping and other equipment at Omar mine, where a wire-rope haulage system, mine cars and other machinery will be installed. Entire program will cost more than $100,000. T. A. Stroup is chief engineer in charge.

M. Nirdlinger, Empire Building, Pittsburgh, architect, has plans for automobile service, repair and garage building, to cost about $140,000 with equipment.

Mill Creek Coal & Coke Co., Maybury, W. Va., is considering rebuilding tipple at local Elkhorn colliery destroyed by fire Nov. 25.

Chicago

CHICAGO, Dec. 3.—Both new buying and fresh inquiries continue to taper. However, dealers, in summing up business for November, find the total volume to be near their estimate of normal for this time of year. Of considerable importance in gaging the present market is the fact that cancellations of existing orders have been made only in a few unimportant cases. It is quite noticeable that buyers are much less insistent on deliveries than at the time orders were signed. Agricultural machinery manufacturers are still in the market, but are paying closer attention to orders placed.

Illinois Steel Co. is expected to issue a sizable list for a new machine shop. An independent steel producer is in the market for a radial drill and a planer. Chicago & North Western will buy two rotary shears, one for ½-in. and one for 1-in. plate. Chicago, St. Paul, Minneapolis & Omaha will purchase an 18-in. lathe, an 18-in. motor-driven grinder and a 36-in. drill.

Edgar T. Ward Sons & Co., 1455 West Thirty-seventh Street, Chicago, headquarters at Pittsburgh, has plans for a one and two-story factory branch, storage and distributing plant, to cost about $120,000 with equipment. A. Epstein, 2001 Pershing Road, is architect and engineer.

Utilities Power & Light Corporation, 327 South LaSalle Street, Chicago, operating electric light and power utilities in different parts of country, is arranging an expansion and improvement program to cost about $60,000,000, including completion of new steam-operated electric power plants of subsidiary companies, extensions in transmission lines, as well as expansion in gas properties and other work.

Grant Storage Battery Co., 226 North Second Street, Minneapolis, Minn., manufacturer of electric storage batteries, has awarded a general contract to August Cederstrand & Co., 966 Central Avenue, for a one-story addition, 200 x 300 ft., to cost about $100,000 with equipment. O. L. Schultz is president and treasurer.

Laurel Oil & Refining Co., Laurel, Mont., recently organized, has approved plans for a new refinery on local site for production of fuel oil, gasoline, road oil, asphalt and affiliated by-products. Initial plant will cost close to $850,000 and will be ready for service in spring. Smith Engineering Co., 107 West Linwood Boulevard, Kansas City, Mo., is engineer. Alfred J. Diescher, formerly vice-president and general manager of Empire properties of Cities Service Co., 60 Wall Street, New York, heads new organization.

Illinois Steel Co., 208 South La Salle Street, Chicago, has plans for a one-story machine shop, 50 x 300 ft., at South Chicago works, to cost $250,000 with equipment. L. C. B. Holmboe is company architect.

Northern Pacific Railway Co., 176 East Fifth Street, St. Paul, Minn., has awarded general contract to E. G. Evensta Co., 2135 California Street, N. E., Minneapolis, Minn., for additions to engine house with shop facilities at Mandan, N. D., to cost about $70,000. O. M. Regnan is company architect.

Charles A. Olson & Son, Inc., 2945 Pillsbury Avenue, Minneapolis, manufacturer of commercial automobile bodies, has asked bids on general contract for a one and two-story plant unit, to cost about $40,000 with equipment. C. J. Bard, Builders' Exchange, is architect.

International Harvester Co., 606 South Michigan Avenue, Chicago, will soon begin erection of two-story and basement factory branch and distributing plant at Sioux City, Iowa, 150 x 225 ft., to cost about $150,000 with equipment.

Gerrard Co., Inc., Cicero, Ill., manufacturer of wire-tying machinery, has started construction of a two-story factory and office building, 130 x 250 ft., at 2915 West Forty-seventh Street, Chicago. Mundie & Jensen are architects.

Milwaukee

MILWAUKEE, Dec. 3.—Machine tool buying is slowly increasing after a lull which was at no time pronounced. Inquiries are also more frequent and come from various industries. Jobbing machinists are in the market to a much greater extent than recently. Improvement in deliveries of machine tool is noted by some builders. Manufacturers of large tractors and excavating equipment are operating at close to capacity and output is being gradually increased by makers of automobiles, automotive equipment, farm implements and small tractors.

Davis & Thompson Co., Fifty-seventh Avenue and Mitchell Street, West Allis, Wis., manufacturer of drilling, milling, pipe-threading and special machines, reports orders sufficient to keep plant operating at capacity until June. Recent business includes special machines for Soviet Government's tractor plant.

Trane Co., LaCrosse, Wis., manufacturer of heating specialties, plans expansion through an increase of capital stock from $600,000 to $800,000.

Portage Mfg. Co., Portage, Wis., manufacturer of ice cream freezers, vacuum cleaners and other household specialties, recently incorporated for $125,000, has begun manufacturing operations in temporary quarters at 2718 Atwood Avenue, Madison, Wis., pending completion of plant at Portage, construction of which will begin in spring. J. E. Hoffman, of Hoffman Mfg. Co., Chicago, is designer of some products and is active in new company.

John Deere Plow Co., Moline, Ill., has let contract to John Hunzinger Construction Co., 144 East Wells Street, Milwaukee, for a five-story warehouse and office building, and one-story loading platform, 26 x 102 ft.

Briggs & Stratton Corporation, Milwaukee, manufacturer of automobile ignition switches, window lifters, air compressors and gasoline engines, announce expansion in its line of portable gasoline engines through production of a 2-hp. high-speed engine weighing 40 lb., built largely of aluminum, also a new 3-hp. light-weight motor.

Young Radiator Co., Racine, Wis., is planning to double its manufacturing capacity by installation of additional equipment and by augmenting its personnel. Company, of which F. M. Young is president, makes industrial type internal combustion engine cooling radiators for trucks, power units and industrial machinery, hot water automobile heaters and new type forced draft heating units for factories and buildings.

Cincinnati

CINCINNATI, Dec. 2.—Sales of machine tools the past week were well below the average weekly volume of the past three or four months. A number of contracts are pending on which buyers have received quotations, but have not yet signified any immediate intention of closing. Among these is one from the Russian Government for a quantity of lathes, on which quotations were submitted sometime ago. While inquiry is in fair volume, it is not as brisk as two weeks ago. District plants are operating on good schedules and no slackening of production is anticipated for some time.

Cincinnati Engineering Tool Co., 4659 Spring Grove Avenue, Cincinnati, has awarded general contract to Fisher-Devore Construction Co., Dixie Terminal Building, for one-story unit at Knowltons Corner, to cost about $45,000 with equipment.

Dayton Rubber Mfg. Co., Dayton, Ohio, manufacturer of automobile tires, mechanical rubber goods, etc., is considering purchase of site at Los Angeles for new branch plant, to cost more than $1,000,000 with machinery.

Smith Agricultural Chemical Co., Columbus, Ohio, fertilizer products, has awarded general contract to Middle States Construction Co., 1183 Essex Avenue, for a one-story storage and distributing plant, to cost about $40,000 with equipment. Improvements will also be made in present plant.

Nashville Gas & Heating Co., 226 Sixth Avenue, North, Nashville, Tenn., a subsidiary of United Gas Improvement Co., 1401 Arch Street, Philadelphia, is arranging for expansion to cost about $370,000, including increased gas-generating facilities, storage and distributing units.

Prichett-Thomas Co., Stahlman Building, Nashville, Tenn., has broken ground for new multi-story automobile service, repair and garage building, to cost about $400,000 with equipment. Marr & Holman, Stahlman Building, are architects.

Procter & Gamble Co., Gwynne Building, Cincinnati, has acquired property at Long Beach, Cal., for early construction of new plant for Pacific Coast trade, to cost about $5,000,000 with machinery. Work is in progress on similar plant at Baltimore.

North American Utilities Co., Madisonville, Ky., recently formed by W. B. Doty, Madisonville, and associates, is planning construction of artificial gas plant near Paris, Tenn., to cost about $100,000 with

equipment. Company plans pipe lines for service at Mayfield and Fulton, Ky., and vicinity.

Brown Wood Preserving Co., Louisville, recently formed as a subsidiary of W. P. Brown & Sons Lumber Co., Louisville, will install a boiler plant in connection with wood-treating and preserving plant at Highland Park, also storage tanks, pumps, air compressors, etc., as well as conveying and elevating equipment. Entire project will cost over $1,000,000 with equipment. J. Graham Brown is president. Grant B. Shipley, Koppers Building, Pittsburgh, is consulting engineer.

Board of Education, Norwood, Ohio, is considering installation of manual training equipment in addition to junior high school to cost $300,000. Charles F. Collarius, St. Paul Building, Cincinnati, is architect.

Cleveland

CLEVELAND, Dec. 3.—While the volume of machine tool business has shown a considerable decline recently, there is still quite a little activity. The United Engineering & Foundry Co., Pittsburgh, which is enlarging its Canton, Ohio, plant, purchased four large turret lathes the past week from a Cleveland dealer, involving an expenditure of about $50,000. The Thew Shovel Co., Lorain, added to its recent purchase a 42-in. boring machine and is inquiring for a 27-in. lathe. This company may buy one or two additional machines early in the year. The Goodyear Tire & Rubber Co., Akron, has an inquiry out for two small machines.

November sales showed quite a falling off as compared with October and little activity is looked for in December. However, quite a few plants in various metal-working industries are considering the purchase of new equipment, but are deferring placing orders until January.

E. I. Du Pont de Nemours Co., Wilmington, Del., has awarded a contract to Austin Co., Cleveland, for a one-story machine shop, 90 x 197 ft., to cost about $75,000.

Hammond Mfg. Co., 7808 Kinsman Road, Cleveland, manufacturer of drilling machinery, will erect a new one-story factory, 75 x 129 ft.

Strong, Carlisle & Hammond Co., Cleveland, has been given exclusive sales agency in Cleveland territory for line of milling machines made by Kempsmith Mfg. Co.

General Fireproofing Co., Youngstown, plans to start operating this month a new plant to manufacture aluminum office chairs.

Firestone Tire & Rubber Co., Akron, Ohio, has authorized expansion and improvements at branch mill at Los Angeles, to cost about $2,500,000 with machinery. Work is scheduled for completion within 60 to 90 days. Company has plans by Lockwood Greene Engineers, Inc., Hanna Building, Cleveland, for three-story factory branch, service and distributing plant at Toledo, Ohio, to cost about $200,000 with equipment.

Atlas Steel & Supply Co., 4401 Trumbull Avenue, Cleveland, has asked bids on general contract for three-story addition to storage and distributing plant, to cost more than $65,000 with equipment. Walter J. Wefel, 5716 Euclid Avenue, is architect.

Thew Shovel Co., Lorain, Ohio, manufacturer of steam and gasoline shovels, etc., is planning expansion to cost about $100,000 with equipment.

Youngstown Radio, Lamp & Novelty Co., Scienceville Road, Youngstown, Ohio, will ask bids on general contract early in January for one and two-story addition, to cost about $25,000 with equipment. Zenk & Campbell, 120 Wood Street, are architects.

St. Louis

ST. LOUIS, Dec. 2.—J. R. Brockman Mfg. Co., 617 North Second Street, St. Louis, manufacturer of pipe, pipe bends, etc., is considering one-story plant unit at 3806-16 Market Street, to cost over $80,000 with equipment.

Hoffman Aircraft Co., 1010 Pine Street, St. Louis, has plans for a one-story steam power plant, 30 x 40 ft., at Anglum, Mo., airport, to cost about $35,000 with equipment. B. Russell Shaw, Arcade Building, is architect.

Fremont Foundry & Bearing Works, Inc., 1338 West Fifth Place, Oklahoma City, Okla., will build a one-story factory branch, service and distributing shop at Tulsa, Okla., with facilities for repair of mechanical equipment used in oil field operations, to cost about $25,000 including equipment.

Edward J. Peters, Elks Building, Shawnee, Okla., architect, has awarded general contract to Tankersley Construction Co., Cotton Exchange Building, Oklahoma City, for three-story and basement automobile service, repair and garage building, 125 x 160 ft., at Oklahoma City, to cost about $120,000 with equipment.

Hussman-Ligonier Co., 911 North Broadway, St. Louis, manufacturer of electric refrigerating equipment, etc., has purchased Gustav J. Gruendler Mfg. Co., 814 North Broadway, manufacturer of commercial electric refrigerator units, and will consolidate. Different units include company last noted, Hussman Refrigerator Co., and Ligonier Refrigerator Co., as well as Steiner Mfg. Co., address stated. Expansion is planned in different types of electrically-operated refrigerator equipment. A subsidiary has been formed under name of Allied Store Utilities Co., for sales and distribution.

Springfield Tablet Mfg. Co., 300 North Jefferson Street, Springfield, Mo., manufacturer of commercial paper products, has asked bids on general contract for two-story L-shaped factory, 60 x 120 ft., with one-story unit adjoining, 50 x 60 ft., to cost more than $75,000 with equipment. Baldwin & Baldwin, Magnolia Building, Oklahoma City, Okla., are architects.

Shell Development Co., affiliated with Shell Petroleum Co., Shell Building, St. Louis, has acquired 135-acre tract near Long Beach, Cal., as site for new nitrogen fixation plant, for which plans will be prepared at once. Initial unit will be equipped with electrically-operated machinery, and will cost about $250,000. Entire project will cost over $1,000,000 with equipment.

All-Steel Products Mfg. Co., 300 South Wichita Street, Wichita, Kan., has awarded general contract to Aaron Wilson, 217 South Terrace Drive, for one-story plant to cost about $40,000 with equipment. Ted Mason, Miller Theater Building, is architect.

Moon Motor Car Co., 4400 North Main Street, St. Louis, has purchased plant rights and property of Ruxton front-drive automobiles, heretofore held by New Era Motors, Inc., St. Louis, and will arrange for early production at local plant, where manufacture will be concentrated in future.

Mine-LaMotte Co., Bonne Terre, Mo., has purchased a 42 in. x 21 ft. motor-driven Putnam lathe from Manning, Maxwell & Moore, Inc.

Missouri Pacific Railroad has purchased a locomotive crankpin grinder and a Monarch 24 in. x 14 ft. geared-head motor-driven heavy-duty geared-head lathe.

Gulf States

BIRMINGHAM, Dec. 3.—Contract has been let by Motor Tool Specialty Co., 2119 Commerce Street, Dallas, Tex., to Cowdin Brothers, Dallas, for one-story plant, 50 x 100 ft., to cost about $25,000 with equipment.

Texas Milk Products Co., Marshall, Tex., has asked bids on general contract for one-story milk processing plant at Mount Pleasant, Tex., to cost about $175,000 with equipment.

Crane Co., 836 South Michigan Avenue, Chicago, has taken bids on general contract for a factory branch, storage and distributing plant at Jacksonville, Fla., three stories, 100 x 105 ft., to cost about $100,000 with equipment.

Perry Burrus Elevators, Inc., Dallas, Tex., has authorized addition to local grain elevator, to include elevating, conveying, screening and other equipment, to cost over $1,000,000 with equipment.

West Texas Utilities Co., Abilene, Tex., is arranging an expansion and improvement program to cost about $5,000,000, including increase in generating facilities, power substations, transmission lines and other work.

State Highway Department, Austin, Tex., is considering erection of a one-story mechanical and repair shop for road machinery work, and one-story equipment storage and distributing plant at Dallas, Tex., to cost over $50,000 with equipment.

Roosevelt Flying Service, West Palm Beach, Fla., W. P. Lawless, in charge, has acquired local property for establishment of airport, to include hangars for housing about 20 airplanes, repair shops, oil storage and other field units, to cost more than $100,000 with equipment. Company is a subsidiary of Aviation Corporation, 122 East Forty-second Street, New York.

Board of Education, Birmingham, plans installation of manual training equipment in new West End high school, bids for first unit being asked by Dec. 13, to cost $750,000. Warren, Knight & Davis, Protective Life Building, are architects; William B. Ittner, Board of Education Building, St. Louis, is consulting architect. D. E. McKinley is business manager.

City Council, Gulfport, Miss., has plans for extensions at municipal airport, to include new hangar to accommodate six airplanes, with repair facilities and other field units, to cost over $50,000.

Minden Cotton Oil & Ice Co., Minden, La., has plans for a new factory for manufacture of commercial fertilizer, to cost over $65,000 with equipment.

Board of Education, Tyler, Tex., is planning installation of manual training equipment in two new junior high schools to cost $261,000, for which bids will soon be asked on general contract. Bryan & Sharp, Dallas, Tex., are architects.

E. F. Slayton Co., Orlando, Fla., plans construction of a cold storage and refrigerating plant in connection with new abattoir, including installation of conveying and other mechanical-handling equipment, to cost about $100,000. E. F. Slayton, 525 Howard Avenue, is head.

Bell Oil & Gas Co., Kennedy Building, Tulsa, Okla., has approved plans for new oil refinery near Pampa, Tex., with initial capacity of 4000 bbl. per day, including gasoline division, to cost over $200,000.

Indiana

INDIANAPOLIS, Dec. 2.—Haynes Stellite Co., Kokomo, has awarded general contract to L. P. Hutto, 1030 West Maple Street, for one-story addition, 75 x 125 ft., to be used primarily as a foundry, to cost about $50,000 with equipment.

O. P. Link Handle Co., Salem, has authorized rebuilding part of plant destroyed by fire Nov. 23. Reconstruction will be designed to double former capacity and will cost about $50,000 with equipment.

Capehart Automatic Phonograph Co., East Pontiac Street, Fort Wayne, will take bids early next year for one-story addition, to cost about $30,000 with equipment. Charles E. Weatherhogg, 250 West Wayne Street, is architect.

Inca Mfg. Co., Fort Wayne, manufacturer of wire and cables, has awarded a general contract to Buesching & Hagerman Construction Co., 402 East Superior Street, for one-story unit, 200 x 300 ft., to cost over $75,000 with equipment.

Engineering Metal Products Corporation, Indianapolis, has been organized to take over and consolidate T. Roch Iron Works, 600 Dorman Street, manufacturer of ornamental iron products; James H. Carnine & Co., 311 East South Street, building products, including fireproofing materials; Central Wire & Iron Works, 119 West Norwood Street, manufacturer of elevator doorway equipment, etc., and Diamond Wire & Iron Works, 310 East Empire Street, manufacturer of office and factory partitions, etc. Consolidated company plans general expansion. Lease has been secured on property at 401 South Harding Street, where headquarters will be maintained. James H. Carnine is president of new organization; F. G. Phillips, vice-president; George H. Roch, treasurer, and Ralph E. Finley, chief engineer.

Auburn Automobile Co., Auburn, has authorized an expansion program to increase present output by 50 per cent, including new units now in progress, to cost about $3,500,000 with machinery. Program includes extensions at plant of Central Body Co., Connersville, and expansion at Auburn-Connersville automobile works.

Pacific Coast

SAN FRANCISCO, Nov. 27.—Bids have been asked on general contract by Board of Works, Oakland, Cal., for municipal mechanical and equipment buildings, 200 x 200 ft., including machine shop, repair shop, paint shop and other units, to cost $75,000 with equipment. L. C. and D. D. Stone, Great Western Power Building, are architects.

Byron Jackson Pump Co., 55 New Montgomery Street, San Francisco, manufacturer of pumps, parts, etc., has filed plans for one-story unit at Berkeley, Cal., to cost about $30,000 with equipment.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has secured permission for a hydro-electric power project on Mokelumne River and will proceed with project at early date, to cost $19,000,000 with transmission system. Company is arranging an expansion program to cost about $35,000,000, including extensions in hydro-electric and steam power properties, transmission lines, switching stations, distributing lines and miscellaneous work. Natural gas properties also will be extended and developed.

Woodruff-Margetts Coal Co., Salt Lake City, Utah, has plans for a coal-carbonizing plant, to cost about $65,000 with equipment.

Sunset Pacific Oil Co., Sixteenth Street, S. W., and Hanford Street, South, is planning new oil storage and distributing plant to cost about $75,000 with equipment.

Board of Education, San Francisco, is considering installation of manual training equipment in third unit at South Side high school, to cost about $700,000, for which plans will be prepared by Bakewell & Weihe, 251 Kearny Street, architects.

In connection with an expansion program to cost $50,000,000, Southern Pacific Railroad Co., Los Angeles, is planning purchase of track-building and kindred equipment, including cranes, ditchers, steam shovels, etc. Extensions and improvements will also be made in a number of car and locomotive repair shops, with installation of additional equipment.

Boise Machine & Welding Works, Inc., Boise, Idaho, has leased a one-story building, 50 x 120 ft., to be erected at 1401 Idaho Street, and will occupy for a new plant, to cost about $30,000 with equipment. Tourtellotte & Hummel, Boise, are architects.

Southern California Gas Co., Los Angeles, has applied for permission to purchase properties at Madera and Turlock, comprising holdings of Madera Gas Co., and Turlock Gas Co., and will consolidate. Expansion is planned, including pipe line construction.

Canada

TORONTO, Dec. 3.—Current demand is chiefly for replacement needs, with occasional lists calling for a half dozen tools. Some good orders are pending for new works, but much of this business will be held over until after the first of the year. While there has been curtailment in demand, business, as a whole, is holding well above that of a year ago.

J. D. Adams Mfg. Co., manufacturer of railroad shop machinery, has purchased an existing plant and eight acres at Paris, Ont. Plant will be operated by a subsidiary to be known as J. D. Adams (Canada), Ltd., and will supply Canadian demand and some export trade.

S. C. Johnson & Co., Brantford, Ont., manufacturers of radiator cement, etc., will build an addition to cost $50,000.

Town Council, Hespeler, Ont., contemplates installing additional pumping apparatus in waterworks plant. M. E. Jardine is clerk.

Niagara Cut Stone Co., Ltd., Niagara Falls, Ont., has awarded contract to Smith Brothers, 1740 Ellen Avenue, for erection of a factory.

Cunningham & Son, 285 Queen Street, St. Catharines, Ont., have let contract to W. W. Park, 49 Queen Street, for erection of a foundry to replace one destroyed by fire.

Peerless Artificial Stone Co., Rhodes Avenue, Toronto, Ont., is receiving bids, no closing date set, for a factory to cost $20,000.

Bids are being received by D. R. Brown, architect, 980 St. Catharine Street West, for an addition and alterations to plant of Jenkins Brothers, 617 St. Remi Street, Montreal, manufacturers of valves, etc.

La Cie Electrique de Riviere a Pierre, Ltd., 72 Mountain Hill, Quebec, contemplates building an addition to power plant at Riviere a Pierre, Que., and will install waterwheel of 300-hp. capacity; one 225 kva. generator, and one 48-ft. diameter penstock, 450 ft. long. C. Lessard, 32 Boulevard des Allies, Quebec, is engineer.

Western Canada

Canadian National Railways is proceeding with erection of new car shops at Melville, Sask. A. A. Tisdale, Winnipeg, is general manager.

New Westminster Paper Co., Ltd., New Westminster, B. C., has awarded contract to Dominion Construction Co., for erection of a paper mill to cost $150,000.

Foreign

A CONTROLLING interest in Bavarian Motor Works, Ltd., Munich, Germany, has been secured by Pratt & Whitney Aircraft Co., Hartford, Conn., manufacturer of Wasp and other aircraft engines, a subsidiary of United Aircraft & Transport Co., 51 Pine Street, New York. Purchasing company will be active in management and will develop Munich plant for production of aircraft motors and parts for Continental trade.

Ford Motor Co., Detroit, is negotiating for land at Kastrup airdrome, Copenhagen, Denmark, and plans construction of plant for airplane division, including parts and assembling departments, to cost over $750,000 with machinery. Company is carrying out expansion at tractor manufacturing plant at Cork, Ireland, and will increase output from 125 to 300 complete tractor units per day. In connection with plans for importations to United States, it is proposed to build two or more assembling plants near ocean ports for domestic business.

Royal Dutch Petroleum Co., Amsterdam, Holland, operating Shell Oil Co., San Francisco, with other subsidiary units in United States, as well as oil refining properties in different parts of the world, has authorized an increase in capital from 600,000,000 to 1,000,000,000 florins (about $240,000,000 to $400,000,000, United States currency), part of proceeds to be used for expansion and improvements, and acquisition of other oil lands and plants.

Municipal Council, Juarez, Mexico, is considering early call for bids for equipment for municipal waterworks, including pumping machinery, power equipment, compressors and auxiliaries, to cost over $200,000.

Farnum Aircraft Co. of France, Paris, has purchased 75-acre tract in Belmont County, near Shadyside, Ohio, and plans early construction of American branch plant, including parts production and assembling, to cost more than $250,000 with equipment.

Rhine-Westphalia Electric Power Corporation (Rheinisch-Westfaelisches Elektrizitaetswerk), Berlin, Germany, has authorized increase in capital from 180,000,000 to 240,000 marks (about $45,000,000 to $60,000,000 United States currency), part of fund to be used for expansion in electric generating plants and systems, including development of new properties.

New Trade Publications

Electric Furnaces and Pyrometers.—Hoskins Mfg. Co., Detroit. A beautifully illustrated 40-page book, identified as catalog No. 52, has been issued by this company. It is divided into three parts, the first of which is de-

voted to a description of Hoskins electric furnaces in the larger sizes for industrial purposes, the second to smaller types commonly used in the laboratory and the third to Hoskins pyrometers. The question, "What is good furnace design?" is discussed in the fore part of the catalog. In the rear of the catalog is a compilation of data regarding methods of heat treating steel, and S.A.E. steel specifications.

Chromel.—Hoskins Mfg. Co., Detroit. Catalog G, consisting of 40 pages, describes the properties of resistance wire, thermocouples, electric furnace ribbon and heat-resisting alloys made of Chromel. In the rear part of the catalog are published tables of Fahrenheit and Centigrade equivalents, fraction and decimal equivalents, comparison of wire gages and conversion factors.

Automatic Control Recording Pyrometers.—Brown Instrument Co., Philadelphia. A four-page folder describes the satisfactory operation of the company's pyrometers in two industrial plants.

Truscon Ferrobord Ingot Iron Roofdecks.—Truscon Steel Co., Youngstown, Ohio. A 16-page booklet is devoted to erection data and specifications of roofdecks and is designed for the practical roofer and roofing contractor.

Steel Castings.—Lebanon Steel Foundry, Lebanon, Pa. A four-page illustrated leaflet describing a motor truck transmission case of intricate design, suitable for motor trucks where particularly heavy duty is involved.

Sash Weights.—Deved Brothers, Inc., 807 South Howard Street, Baltimore. An illustrated leaflet describes the patented combination core box for making sash weights on a large scale.

Foundry Cupolas.—Whiting Corporation, Harvey, Ill. An eight-page pamphlet, entitled "An Analysis of the Performance of 54-Inch Cupolas Based Upon Records of Practical Operation," is one of a series of papers on Cast Iron and Its Manufacture by Dr. Edward E. Marbaker, director of foundry research of the company. Among other subjects it discusses the temperature of the molten iron, the coke consumption, thermal efficiency and the theoretical calculation of coke and air.

Power Plant Equipment.—Chain Belt Co., Milwaukee. Folder of four pages illustrating and describing Rex handling and screening equipment for industrial power plants and central stations.

Water Wheels.—James Leffel & Co., Springfield, Ohio. Bulletin W208 illustrates and describes three units of type Z vertical-shaft turbines, 450 to 825 hp., each direct connected to 3-phase, 60-cycle, 2300-volt vertical generator.

Pumps.—Economy Pumping Machinery Co., Chicago. Bulletin 412 of seven pages and Bulletins 413 and 414 of 11 pages each, illustrate and describe various types of non-clogging sewage ejectors, open-shaft vertical and horizontal pumps and split case multi-stage centrifugal pumps.

Steel Shop Equipment.—Standard Pressed Steel Co., Jenkintown, Pa. Form 416 illustrating and describing various types of steel desks and benches for use in shops, factories, warehouses, etc.

Studies in Structural Welding.—Lincoln Electric Co., Cleveland. A series of eight 8½ x 11 in. leaflets illustrating important structural frames, welded in whole or in part, and detailed sketches of welded joints and girders.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

PRESIDENT HOOVER met representatives of agriculture and public utilities in two conferences. The latter told him of plans to expend $1,800,000,000 for extensions and betterments during 1930. The former said that improvement of farm-to-market roads and maintenance of easy credit will be most effective means of governmental cooperation with agriculture.

* * * * *

RETAIL clothing trade is brisk, due to cold weather. Textile manufacture, however, is generally slow. New England industry is feeling the effects of acute depression in Massachusetts cotton mills.

* * * * *

CONSTRUCTION activities enter their usual winter slump. A survey by Engineering News-Record indicates that new building in 1930 will total the average of 1928 and 1929.

* * * * *

GRAINS are noticeably higher in price, and Chicago trade reflects the improvement. Tobacco manufacturing is brisk; good prices for the leaf and for cotton lend good tone to conditions in South and South East. Wholesale and jobbing trade is slow and uncertain, especially in Middle Western States.

* * * * *

PACIFIC North West is suffering from a prolonged drought. Hydro-electric power plants are all but shut down, and electricity is rationed for essential purposes . . . Fisheries, the main industry, have a pack ranking among the six best years in history. Lumbering, however, is much below normal, and unsold stock is increasing. Shingles are selling at lowest prices in years.

* * * * *

SHIPBUILDING firms closed contracts for 213,000 gross tons of vessels during October, as much as an ordinary year's business . . . Thirteen new mail routes to foreign ports are established and offered to those American steamship lines which meet the Post-Office Department's requirements for vessels equal to or better than any competing foreign ships. About 40 new vessels will be required, costing about $250,000,000, 75 per cent of which will be financed by governmental loans . . . Port of New York Authority will build four 1200-ft. piers at Jersey City, together with belt line railroad and super-highway connecting with established trunk lines . . . Weser Shipbuilding Co., builder of the Bremen, reports large deficit and proposes wage reduction.

* * * * *

PATENT office is so far behind that at present rate it will be six years before work is current, reports Commissioner Robertson, asking for at least 100 new examiners.

* * * * *

CONSOLIDATION of two large Southern dairying enterprises marks another of a series of mergers in the food industry . . . General Baking Corporation, which has grouped about 50 bakeries, has completed a 5-year modernization program costing $18,000,000, and announced a reduction in the price of bread . . . Memphis and Cleveland wholesale drug houses merge and announce plan of cooperation with 20,000 independent druggists . . . Dissolution of Warner and Fox film enterprises is sought by Federal suit.

* * * * *

DIVIDENDS were increased or extras declared by 211 corporations during November; 21 usual dividends were passed. New Haven railroad, which resumed dividend payments a year ago after a lapse of 15 years, increased its rate to $6 annually.

* * * * *

AIRPLANE fares from Kansas City to Los Angeles are reduced for a 30-day trial period to about the same as rail plus Pullman plus meals, by Western Air Express, which has traffic arrangements with a score of Central trunk railroads . . . A 19-hour air-rail service is inaugurated from Cincinnati to New Orleans . . . Commercial aeronautics have a bright future in Central and South America, said C. A. Lindbergh, because other systems of transport are unusually slow and undeveloped . . . Capt. L. M. Woolson, designer of the Packard Diesel aviation engine, said it will cut the fuel load 20 per cent for a given radius of flight . . . A marked reduction in accidents is reported by the commander of the Army air corps, due to the perfection of the mechanism and rigid inspection requirements. Pilot errors constitute the major cause of fatal accidents . . . England adopts a "robot" pilot weighing 100 lb. as standard equipment on larger army and navy aircraft. It has flown bombing planes 400 miles without adjustments.

* * * * *

ARMY strength of the United States is 137,529, reports Adjutant General . . . General Jan C. Smuts of South Africa said that aerial disarmament is more urgent than military limitation, as it constitutes the more serious danger . . . E. N. Hurley, in a proposal to Internation Chamber of Commerce, writes that a few powerful industrialists, controlling strategic minerals and munitions could effectively support Kellogg peace treaties by refusing all trade with belligerants.

* * * * *

FRENCH troops are withdrawn from second zone of occupied area in Rhineland . . . Iceland, with 100,000 inhabitants is shocked by the news of its first murder in 16 years . . . A new traffic law in England abolishes the dead-letter speed limit for light cars, but imposes very severe penalties for dangerous or intoxicated driving, or exceeding 30 miles per hour with buses or trucks.

Mergers Do Not Insure Low Costs

Mere Size of Consolidation Will Not Bring Reduction in Distribution Expense—Real Managerial Ability Is Most Important Factor

BY B. C. MILNER, JR.*

IT is impossible for me to conceive of any question which is more difficult to answer than that which I have been asked to discuss—"Do Consolidations Result in Reduction of Distribution Expenses?"

Unquestionably this is the most important problem facing American business men today. Consolidations during the first 20 years of this century were almost invariably based upon effecting economies in production. To a very large extent the possibility of effecting major savings in the cost of goods has been eliminated by the work which has already been done. It goes without saying that further ways of decreasing costs of production are being and will be developed, and I sincerely trust that this process will never cease. However, it must be recognized that, speaking in general terms, further savings in the costs of production will be in terms of fractions of per cent, or in pennies per unit.

Again, speaking in general, we may say that the substantial profits of the past have been earned by the companies that first learned how to produce more cheaply than their competitors. The profits of the future will go to the companies who learn how to distribute with greatest economy.

At this point it might be well for me to state frankly that I do not believe any one man can give a comprehensive and conclusive answer. There are numerous consolidations, with which you are all familiar, which have been eminently successful.

Fortunately, or unfortunately, developments of the past 45 days have brought very forcibly to our attention the fact that we have numerous mergers and consolidations which have received very little publicity, and which are not, and probably never will be, really successful.

Within the past few weeks we have read and heard many explanations for the crash in security prices on the Stock Exchange of the United States. Somewhere among these I read an article, in which paper and by whom I have forgotten, to the general effect that part of our ills was due to the fact that many consolidations had been effected solely because there was a "finder's commission" to the promoter, and a handsome profit to the banker who floated the securities.

It is a very simple matter to take the balance sheets and operating statements of two or more companies and to set down their figures in parallel columns. Working out estimates as to what might happen if these companies were consolidated has a distinct fascination. The process that is ordinarily followed includes an estimated increase in sales, an estimated saving in cost of sales, an estimated decrease in selling expenses and in administrative expenses, and consequently the estimated future operating profit is enormously increased.

Following the same process the balance sheet figures are totaled and then these totals changed to allow for amounts by which fixed investment can be decreased, inventories lowered, cash balances increased, fixed charges reduced, and so on.

In theory all of the estimates are correct, and the resultant figures are usually highly satisfactory from every angle. Theoretically, if two competing companies are consolidated, sales should increase. It would seem that eliminating the competition between two selling organizations and concentrating the efforts of those organizations under one executive should result in increasing sales both by obtaining a larger share of the existing business, and by increasing the market. Similarly, the consolidation of production facilities and the elimination of the least efficient plants should make it possible to decrease direct costs and to scale down overheads. In theory at least both sales and the administrative expenses should be decreased following a consolidation. Only one set of officers will be required, only one sales manager will be necessary, one production manager can be eliminated, and so on.

Again in theory, where two or more companies are merged it should be possible to carry on the combined businesses with less plant and machinery, with less inventory, with smaller fixed charges, and as a consequence of all of these things the net profits available for dividends should be tremendously increased.

No Way of Estimating Effect on Morale

It is very unfortunate that actual results obtained by consolidations do not always work out according to the estimates, and the fundamental reason for this is that no one has devised any method of estimating future results of the most important element in any consolidation—the human beings who are to be picked out of their separate organizations and thrown together, without their advice

*Ford, Bacon & Davis, Inc., New York. Paper, substantially in full, read before Taylor Society in New York, Dec. 6.

or consent, to work under circumstances which may or may not be pleasant, with new associates whom they may or may not like, and at tasks for which they may or may not be prepared.

Any of us can take two factories and place them under common ownership with full assurance that we will have so many square feet of floor space, so many machines and other facilities. Any one of us can take two bank balances and add them together with full assurance that the result will be a given number of dollars; but no formula has been devised whereby we can put together two presidents, or two sales managers, or two stenographers, or two workmen, with any assurance that the net result will be even one competent executive, or one aggressive merchandiser or one satisfactory secretary, or one efficient producer.

It is because of this essential human element that many consolidations fail to measure up to the estimates prepared by promoters. It is an unfortunate fact that most mergers which have been effected have entirely disregarded the persons who are to operate and manage the combination. The general feeling seems to be that if terms and conditions as to securities can be agreed upon, and the president of one company made chairman of the board, while the president of the other company becomes president of the consolidation, that no further thought need be given to the matter.

Few Mergers Really Successful

You are probably all familiar with the statistics regarding mergers prepared by Prof. Arthur Stone Dewing of Harvard University. Out of 35 major industrial consolidations effected between 1893 and 1902, in only three instances were the actual earnings for the first year equal to the estimated earnings; in only 13 cases were the earnings the first year for the consolidation equivalent to the earnings of the separate companies prior to the merger, and in only 14 cases were the earnings in the tenth year after consolidation equal to the earnings of the separate companies. It is my belief that if the same information were available on all mergers which have been effected in this country to date that very much the same situation would be revealed.

The engineering work of Ford, Bacon & Davis, Inc., has brought us into intimate relationship with numerous public utility and industrial consolidations during the past 35 years. Our work is of a type and character which makes it essential that we should procure an intimate knowledge of operations of these companies. This has enabled us to obtain a detailed cross-section of American business, which is not usually available. It might, therefore, be of interest to cite some of the specific situations which we have seen develop, or which we have been in position to watch in subsequent periods.

Merger of Motor Car Accessory Makers Fails

Company "A" was a medium-sized manufacturer of an integral part of automotive vehicles. The company had grown at an astonishing rate from a very small beginning and it reached a position of pre-eminence in its particular field. The president of the company was a man of unbounded energy, enthusiasm and a wonderful personality. He had started as an apprentice in a machine shop and his ability as an economical producer was unquestioned. He had, also, a special ability for picking, training and controlling production men. Merchandising, however, was a closed book as far as he was concerned and unfortunately he did not exercise the same keen discretion in choosing his sales organization as was so evident in the building of his production division.

The company continued to grow in spite of, rather than because of, its selling organization. A promoter suggested that the company absorb two other companies manufacturing non-competing products, also applicable to the motor car industry. Based on past records and estimated future earnings the consolidation was readily financed. The important element in the estimated increased earnings to be effected by the consolidation was the sales of the products of the three companies by one group of salesmen and the elimination of two sets of sales executives, branch offices, billing clerks, collection departments, etc. Further substantial savings were to be effected by consolidating shipments from three plants in carload lots.

Do Consolidations Result in R

¶ My first generalization would be that consolic ucts are less likely to effect savings in distributio competitive but allied products salable to the sam

¶ My second generalization would be that it standard products which are generally used than cialized products, such as machinery, equipment tively limited clientele.

¶ My third generalization will be a repetition of most important factor—mere size of a consolidatio pendence upon sheer mass is futile.

Dissension and Poor Sales Organization Bring Disaster

The three companies separately had earned in excess of two million dollars net in the year prior to the consolidation. Within three years after the consolidation, the company went into receivership. The cost of distributing the products of this consolidation actually showed an increase while the net sales showed a considerable decrease. As soon as the consolidation was effected, the general sales manager of the major company was given charge of all merchandising activities, with instructions that the best men in each organization were to be retained. Dissension developed immediately, accompanied by a feeling of uncertainty on the part of each member of the sales organization as to whether he was to be retained or discharged. Obviously very little effective sales work was done, for each man was primarily engaged in attempting to protect his own position and at the same time keep an eye out for other employment. By the time the final decision had been reached as to the eventual make-up of the consolidated selling force, it was ascertained that selling expenses had not been decreased to any material extent. Salary raises, based upon the assumed increase in responsibilities, had become rather general. In consolidating branch offices more expensive quarters were acquired, so that branch rents for the consolidation were almost equal to the rentals paid by the three separate companies; traveling and entertainment expenses showed an astonishing increase and calls per salesman decreased by over 50 per cent, the excuse being that each salesman now had to discuss three products and usually had to see three different men in each automobile plant with the consequent delays in going from one man to another or from one department to another. Numerous accounts were lost for each product, as the automobile manufacturers were absolutely unwilling to entrust to any one organization orders for three essential parts of their completed cars or trucks.

A Carefully Planned Merger Succeeds

Some years later, "B" company in an entirely differ-

uction of Distribution Expense?

ons of companies manufacturing competitive prod-an are consolidations of manufacturers of non-eneral market.

sier to effect savings in the cost of distributing fect savings in the cost of distributing more spe-pplies which must be merchandised to a compara-

revious statement. Real managerial ability is the ll not result in decreased cost of distribution. De-

ent field undertook a program of expansion. Careful consideration was given to all conditions prevailing in the particular industry in which this company was engaged and the decision was reached that expansion by consolidation should be effected, but that such consolidation should be with non-competing companies manufacturing products salable in the same general market. The first step was a major merger, carefully worked out, not only with the stockholders of the respective companies but with the operating personnel including the minor executives and department heads.

No attempt was made to eliminate any existing selling expense other than the duplication of branch offices. Branches were opened in numerous cities which neither of the separate companies had been able to afford. Therefore, where offices were consolidated one manager and some of the other employees were moved to new cities, retaining both titles and salaries. The sales staff was not only maintained but was increased by the addition of salesmen to cover the newly opened territories; each salesman continuing to concentrate on the product with which he was best acquainted, but, of course, boosting all the products of his company, and exchanging information with his fellow salesmen as to prospective customers for the allied line.

After an 18-month interval, spent in working out the consolidation of the two organizations, building a real esprit de corps, a third company, manufacturing a different line of products, was brought into the consolidation and similar methods were followed. A year later a fourth company was added. The net result has been an actual increase in sales of approximately 33 per cent over the sales of the separate companies, a decrease of administration expenses equal to 3 per cent of net sales, a decrease in selling expense of approximately 4 per cent and an increase in net profits of almost 250 per cent. Everyone concerned had benefited, the consumer by receiving improved products and better service at lower prices, the employees by increased earnings and steadier work, and the stockholders by increased dividends.

In this particular case the answer to our question would obviously be an enthusiastic affirmative.

Ignoring Personnel Proves Bad Policy

The results of the foregoing case were so entirely favorable that a promoter was able to interest a group of bankers in financing an even larger merger in the same industry, and the operation was carried out, not step by step, but simultaneously. Ten companies were merged at one time.

The first word that the employees of any of these companies had was the appearance in their local paper of an Associated Press dispatch from New York that the consolidation had been effected. The resulting confusion is almost indescribable. For, after all, 10 presidents, 32 vice-presidents, 10 secretaries, 10 treasurers, 10 sales managers and an unknown number of assistant sales managers, branch managers, factory superintendents and salesmen are a difficult group to handle, particularly when they are both astonished and displeased at what has been done by their superiors, and when they are pessimistic as to the workability of the consolidation.

In the first year after consolidation net sales were 40 per cent less than the separate companies had attained during the prior year, the substantial net profits of the individual companies had disappeared and were replaced by an operating loss. The total cost of distribution was decreased by the consolidation but the cost per unit was decidedly increased.

A Case of Sharply Reduced Merchandising Costs

Some years ago two manufacturers of a standard commodity decided to merge. Each company had a moderately successful record. Some refinancing was necessary and the bankers who were approached were frankly skeptical. However, they finally agreed to underwrite the securities after it was pointed out to them that the consolidated companies would probably have sufficient volume of business to eliminate the middleman completely, and to conduct its merchandising direct to the consumer by a selling organization completely controlled by the new corporation.

After the initial difficulties, always encountered in changing from one form of selling to another, the actual operating results attained considerably exceeded the prior estimates. The actual cost of distributing the merchandise through its own sales force proved to be almost 12 per cent less than the discounts and the commissions previously granted the middleman, and the sales of the consolidation were considerably expanded into new fields which the middleman had not discovered. In this case the decrease in the cost of distribution was very material.

A Merger Brings Startling Decrease in Sales

The fact that methods which are successful in one industry, or in one line of commodities, cannot be universally applied may best be illustrated by another merger which was effected simultaneously with the above. A group of companies manufacturing equipment for one of our major industries was consolidated. While each product of the consolidation had a distinct place in the industry, nevertheless each article had to be sold on its merits for the particular purpose then under consideration, and in competition with the products of several other manufacturers. The original purpose of the promoters was the elimination of duplication in salesmen and dealers, the theory being that one salesman could cover the territory previously requiring several men, and that all dealers could be eliminated and the territory which they had served could be covered by a few salesmen at less expense than the commission previously paid.

The immediate results were a startling decrease in sales, and it was not until the bankers stepped in and forced a complete change in management policies that the position was rectified. The improvement did not come through a decrease in distribution expense. Rather, expenses were brought back to the level existing prior to the consolidation. It was found, however, that the larger operation permitted the development of a group of salesmen whose sole purpose was the maintenance of intimate contact with all prospects in their territory. When these men, with their personal acquaintances, were reinforced by specialists whom they could call in to handle particular transactions, they were able to increase sales over any prior records. The enlarged operation warranted the in-

stallation of warehouses at all large centers. Therefore deliveries, an important consideration, could be made, which none of the competitors, compelled to ship from their factories, could possibly meet. Many other benefits of the consolidation developed as time elapsed. The merger today is considered one of our most stable and profitable industries.

Dictatorial Policies Invite Retaliation

Some years ago a merger was effected between several companies manufacturing products of general public use. The participants, the promoters and the bankers cited numerous benefits to be derived from the consolidation, prominent among them being the benefits to be derived both by the company and by the consumer from the decreased cost of distributing the several lines of products. It was pointed out that the consolidation would be the only company in a position to quote on a complete line, that both the wholesaler and the retailer could be almost compelled to carry the full line of products, and that the company would be in position to dictate as to this. It was further pointed out that the company would be in a position to undersell any of its existing competitors, should that become necessary. We were recently requested by a group of bankers to undertake a study of the situation of this company, the question asked of us being, "Shall we supply additional capital to this corporation or shall it be placed in liquidation?"

It developed that the promoters and executives of the original consolidation had not counted the human element in any of their plans. Wholesalers and retailers refused to be coerced. The dictatorial policies originally adopted were keenly resented and at the first possible opportunity retaliatory measures were instigated. Internal friction developed to such an extent that cost of production increased to a point where sales could not be effected at profitable levels. The competitors were quick to take advantage of the situation, first, by hiring away the best men of the organization who had become discouraged over the disagreeable conditions which had developed, second, by increasing their efforts to take care of the business of the wholesalers and retailers previously dependent upon the consolidation, third, by the formation of an association which would effectively eliminate competition between the small companies and direct it almost exclusively against the large company.

Brain Power Is Governing Factor

Instances of this character might be multiplied extensively. I believe, however, that you will have gathered the inference that insofar as our experience goes there is no possibility of answering our question in either the affirmative or the negative. Some consolidations do decrease the cost of distribution, other consolidations increase cost of distribution. Policies and personnel, in other words, brain power seems the governing factor.

There is such a thing, of course, as foolish economy, i.e., an effort to reduce distribution expenses on the basis that merely by such reduction some benefits are received. More often than not the effort should not be to reduce the number of dollars spent but to see that each dollar is spent more effectively and produces a greater volume of business. In this case the reduction of expense is relative rather than actual. In other words the cost of doing business becomes a lesser percentage of the sales dollar.

Good Management Is Imperative

Based upon our own observations we would say that in general the answer to the question depends, to the largest degree, upon the management. We have seen good management handle very difficult situations so skillfully that distribution and other costs were decreased. Likewise, we have seen poor management make a complete botch of operations which were inherently simple and held every promise of success. If a direct answer to the question is necessary, I must resort to generalizations, injecting a warning, however, that there are sufficient exceptions to these generalizations to furnish the basis of endless arguments. [For these concluding statements see p. 1576.]

If I must answer the question "Do consolidations result in reduction of distribution expense," then I must fall back on a precedent established by the Scotch and reply, "Not necessarily."

Arc-Welded Pipe Joints Are 75 Per Cent Efficient

INFORMATION concerning the 624-mile oil line from Cushing, Okla., to refineries near Chicago, has been issued by Lincoln Electric Co., manufacturers of the welding equipment used for making the field joints. Work started last winter, and was continued throughout cold and wet seasons; average production per welder was 10.3 welds per day, although in good weather the best men reached a figure of 25 joints per day.

Pipe was 12-in., electrically welded, with bell and spigot joints on each 40-ft. length. Ninety-one welding generators, driven by gas engines, mounted on wagon beds and drawn by team or tractor, were required. Each weld was completed in two beads. Hydrostatic tests at 800 lb. per sq. in. completed on 354 miles of this line revealed pin-hole leaks in only three of the 47,000 joints. Workmanship was under periodic test and close inspection; a number of joints were cut bodily from the line and pulled apart with the following results:

Test Number	Tensile Strength in Tons		Efficiency of Welded Joint, Per Cent
	Pipe	Welded Joint	
1	386.05	310	80.30
2	431.86	325	75.95
3	419.21	278	66.31
4	346.98	278	80.12
5	349.74	318	90.92
6	366.05	320	87.42
7	441.58	285	64.54
8	413.21	252	60.97
9	428.07	275	64.24
10	342.88	324	94.49
Average	392.57	296.50	75.52

Cleveland Opens Foundry School

Equipment for Training Apprentices Includes a $50,000 Foundry and $15,000 Worth of Machinery Donated by Manufacturers

A TRADE school for foundry training in Cleveland was formally dedicated at a dinner meeting held Dec. 6 in the molding room of the school by Cleveland foundrymen comprising the foundry group of the American Plan Association of that city. Those in attendance also included representatives of the Cleveland Board of Education, members of the manufacturers' committee on industrial training of the Cleveland Chamber of Commerce, foundry equipment manufacturers and the foundry school apprentice boys.

Walter L. Seelbach, president, Forest City-Walworth Run Foundry Co., Cleveland, and of the Gray Iron Institute and chairman of the Foundry Group of the American Plan Association of Cleveland, acted as toastmaster and formally presented the foundry equipment to the Cleveland Board of Education. The principal speaker was Harold S. Falk, vice-president and works manager, Falk Corporation, Milwaukee, who has long been active in promoting apprenticeship training in Milwaukee and as a member of committees of the National Metal Trades Association and of the American Society of Mechanical Engineers. Another speaker was William Frew Long, general manager of the American Plan Association of Cleveland, who reviewed the history of the school.

The school was founded and is being conducted by the cooperative efforts of the Cleveland foundrymen and the Cleveland Board of Education and combines school work with apprentice employment in foundries. It was started at the opening of the school year in September with an enrollment of 28 boys and marks a new step in vocational training in Cleveland.

The aim of the school is to give the boys a thorough training, both technical and practical, in the fundamentals of the foundry trade. The training will include melting and molding of gray iron and non-ferrous metals, brass and aluminum, core making and pattern making. The prime purpose is to train boys by cooperative methods to become skilled molders and core makers for the foundry industry of Cleveland through the combined efforts of the foundrymen and the public schools. With this training it is believed that many of the boys taking the foundry course will be capable of becoming foremen and plant executives.

Foundry Erected Last Summer

The foundries sponsoring the school compose the foundry group of the American Plan Association of Cleveland, which is cooperating with the Department of Vocational Training of the Cleveland Board of Education. A $50,000 foundry for the school was erected during the summer by the school board and the greater part of the equipment

Foundry for Training Apprentices Is Completely Equipped With Standard Type Machinery Used in Regular Production Work. Cupola is in background

was provided by funds contributed by Cleveland foundries and by donations of $15,000 worth of equipment by equipment manufacturers.

Several leading foundrymen of Cleveland cooperated in working out plans for the foundry, which is well arranged for practical operation and which occupies a comparatively limited amount of floor space without the appearance of crowding. While it might be called a miniature foundry, nevertheless it is completely equipped with standard type machinery used in regular production work.

The melting and molding department occupies a well-lighted room 30 x 60 ft., with a high ceiling. At one end is a 2-ton 41-in. Whiting cupola lined down to 27 in. The cupola is tapped into a 1-ton geared mixing ladle. The blower is located on the floor at the side of the cupola. The foundry is served by a traveling crane equipped with a 2-ton electric hoist.

Charging Floor Built in Form of Balcony

At the side of the cupola are two furnaces for melting brass and aluminum. The charging floor is built in the form of a balcony at the end of the foundry. This extends around one side of the room, where space is provided for the storage of patterns, flasks and other material. A raised driveway runs along the cupola end of the building, permitting pig iron, coke and limestone to be discharged from trucks onto the charging room floor. Beneath the driveway are sand storage bins, which open directly back of the cupola. Six molding machines of different types are placed along one side of the foundry.

Separate rooms are provided for the core making, cleaning and pattern making departments. The core room has two core making machines and a drawer type baking oven. The cleaning department equipment includes a sand blast cabinet, a sand blast mill, a 24 x 36-in. tumbling mill and a dust arrestor, all supplied by the W. W. Sly Mfg. Co., as well as a Bridgeport double wheel grinder. Seventeen benches are provided in the pattern making room, which is unusually well lighted through a glass skylight.

The school has a four-year apprenticeship course and admits boys who have completed the eighth grade in the public schools. Boys are spending full time in the school during the first year of their training. Half of this time is being spent in actual foundry work, in molding, core making, melting and mixing, pattern making and cleaning in the school shop. One-third of the time is occupied in such studies as mathematics, foundry technology and mechanical drawing as related to foundry operations. The remaining one-sixth of the time is devoted to such academic subjects as history, English, civics and hygiene.

Students Spend Half of Second Year in Foundries

During the second year the students will spend half time in the school and half time as apprentices in Cleveland foundries, receiving the wages of an apprentice for the time actually employed in the foundry. During the third and fourth years they will be employed in Cleveland foundries as apprentices at full time pay, but will return to the school for a half day each week for special instruction. They will receive their regular wages from their employers for the half day spent each week in school work. Apprentices already employed in Cleveland foundries will be admitted to the school for a half day each week with no tuition charge.

In addition to training apprentices, the school will give special instruction to molders and foundry foremen as soon as facilities can be provided. The school is in charge of James Goldie as chief instructor. Mr. Goldie equipped and operated the foundry division of the Meriden State Trade School at Meriden, Conn., and had previously received a practical training in the foundry industry.

Interest in the foundry school among prospective pupils was created by the distribution of an illustrated booklet in which the plan of the school was outlined and the opportunities for boys in the foundry industry were pointed out. It called attention to the changes that have occurred in the foundry industry on account of the invention of labor saving machinery and the increasing recognition of the need for scientific training and skill which have brought about new standards in this basic industry and which have marked the passing of the day when brawn and muscle were considered the prime essentials for foundry apprentices. This publicity was supplemented by advertisements inserted in the foreign language newspapers in Cleveland before the opening of the school with a view toward attracting students.

Advisory Committee Helped Prepare Course

An advisory committee of foundrymen was appointed to work with representatives of the Board of Education and the chief instructor in preparing the course of instruction and working out other details in connection with the school's operation. This committee serves as a liaison committee between the foundries and the school. It is composed of D. P. Lansdowne, West Steel Casting Co., chairman; Daniel Gluntz, Gluntz Brass Foundry; F. J. Grondie, Kilby Mfg. Co.; and A. B. Norton, United States Aluminum Co. Representing the Board of Education are H. L. Briggs, director of vocational education, and John Fintz, coordinator. In addition, there is a foundry apprenticeship training committee consisting of William H. Shilling, the Atlas Foundry Co., chairman; R. H. West, West Steel Casting Co.; Tracy Calhoun, Johnston & Jennings Co.; George Hamminк, Wellman Bronze Co.; W. J. Strangward, Forest City-Walworth Run Foundries Co.; and Messrs. Grondie, Gluntz and Norton.

Mr. Strangward was chairman of the committee on equipment. Among manufacturers who donated equipment were the Aluminum Foundry Equipment Co., Chisholm-Moore Hoist Corporation, Federal Foundry Supply Co., Foundry Equipment Co., Osborn Mfg. Co., Johnston & Jennings Co., Reliance Electric & Engineering Co., W. W. Sly Mfg. Co., Standard Sand & Machine Co., Standard Pattern Works Co., Sterling Wheelbarrow Co., E. J. Woodison Co., Smith Facing & Supply Co., and Werner G. Smith Co.

An Undersupply of Production Foremen

INVESTIGATIONS conducted by the Society for the Promotion of Engineering Education indicate that the manufacturing industries of the country could absorb yearly about 11,000 graduates of four-year college courses in engineering. To supply this need, and the additional needs of the mining and transportation industries as well, only about 9000 men are graduated each year.

However, a tremendously greater need is felt for men with 2 years of post high-school training—graduates of so-called technical institutes. Such men gravitate toward the production departments in supervisory capacities. Nearly 600,000 such positions exist and only about 10,000 of them are filled by graduates of technical institutes. To supply the replacements needed, 30,000 men should be graduated every year, yet at the present time probably not more than 2000 are being turned out annually by such schools as Pratt and Rochester Mechanics Institutes.

The conclusion, as stated by W. E. Wickenden, investigator for the society, before the meeting of the American Society of Mechanical Engineers last week, is that the numbers of schools offering this "truncated engineering course" should be greatly expanded. They would draw from a couple of million young men who are not fitted for full college work, or who cannot afford it, and would not compete with established institutions for students.

Burns Vitreous Enamel Electrically

Large Continuous Conveyor Furnace Used in Plant of Republic Stamping & Enameling Co.

A CONTINUOUS conveyor type electric furnace for burning in vitreous enamel on kitchen ware was recently placed in operation by the Republic Stamping & Enameling Co., Canton, Ohio. It is a 450-kw., 220-volt, 3-phase furnace of a new type developed by the General Electric Co. and briefly described in THE IRON AGE, Jan. 24, 1929. Several of the furnaces are being used by that company in enameling parts used in the manufacture of electric refrigerators and other products. Not only has the furnace a large capacity, but the quality of the work is said to be much improved because of the close temperature control and the absence of smoke and gases.

Continuous Type Electric Furnace Is Used for Burning Vitreous Enamel on Kitchenware

The furnace is of the closed end type, the work entering and leaving at the same end. The heating units are located in the closed end, which is U shaped, and in it the conveyor makes a loop. The furnace is 83½ ft. long and includes a preheating section approximately 68 ft. long. The first 40 ft. of this section is on a horizontal plane and can be used as a drying zone. The next 28 ft. is an inclined section, the incline being of such a degree that the bottom of the heating or firing chamber is slightly higher than the top of the drying section, so that the heated air is largely confined in the heating chamber. Each side of the firing chamber is 13 ft. long and the U bend is approximately 7½ ft. in length making a total travel in the firing chamber of 33½ ft.

The heating units, which are of nickel-chrome ribbons, are mounted on the side walls of the U and on each side of a center wall which extends partly through the heating chamber. There are three separate temperature control zones, one on the incoming side of the U and two on the outgoing sides, one of the latter being at the top and the other at the bottom in order to keep the temperature uniform at the top and bottom of these two zones. Temperature in the three zones is automatically controlled by Leeds & Northrup instruments including a chart recorder and the temperature is held within a range of 10 deg. Current for the furnace is supplied by a commercial company at 4000 volts, 3-phase, 60-cycle and this is stepped down by transformers to 220 volts.

Work is set on specially designed racks suspended from the conveyor chain on 36-in. centers. The racks, 28 in. long and 28 in. deep, have three adjustable shelves. Each rack will hold 12 moderately sized pieces. The work is set on pins or bucks which are parts of the rack members. The conveyor was built by the Palmer-Bee Co.

The conveyor has a speed range of from 3 to 18 ft. per min. However, the company is operating it at a uniform speed of 12 ft. per min. for burning the three coats, the temperature being reduced for the second and third coats. The ground coat is burned on at a temperature usually ranging from 1680 to 1700 deg. Fahr., the maximum being 1740 deg. and the second and third coats at 1500 to 1560 deg. If the quantity of ware on the conveyor is larger than in usual operations or heavy pieces of ware are being burned, the temperature may be raised or the conveyor run at a slower speed. In normal operations the work is kept in the heating zone 3 min.

While the first or entering zone is intended as a drying zone for drying the enamel after dipping and before burning, thus utilizing the heat that passes from the burning zone, lack of space did not permit the construction of a conveyor of sufficient length for the loading of the wet ware on the conveyor racks. Consequently, drying before burning is done in steam-heated ovens from which the work after cleaning and beading goes to the baking oven.

An output of 30,000 to 34,000 pieces of enamel kitchen ware, or 15 to 17 tons in a day's run of 23 hr., is being obtained with the present furnace operation, but it is stated that were the furnace operated at its maximum capacity this output could be about doubled.

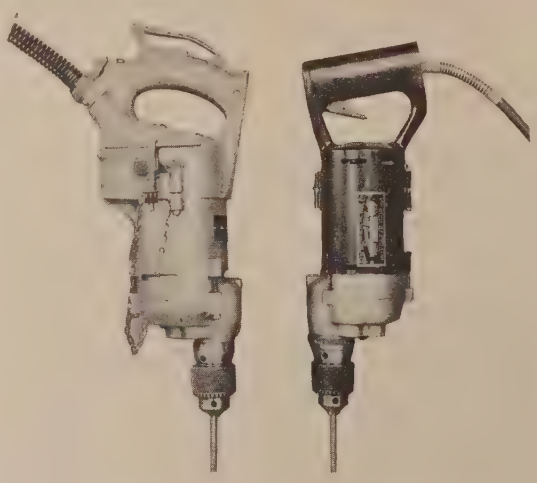
While electric furnaces have been used in this industry for some time, this is the first one of the continuous type used for burning vitreous enamel on kitchenware.

Economy from Use of Pressed Steel

Lower Costs and Handier Operation Follow Redesign of Motor Case and Other Parts of Portable Electric Drill

BY ROGERS A. FISKE*

REDESIGN to permit use of pressed steel motor cases and other parts of several models of portable electric drills produced by the Speed Way Mfg. Co., Cicero, Ill., has resulted in reductions of one-third to one-half in cost of labor and material. The steel case is smaller in outside diameter than the aluminum castings formerly used, and so is the gear case and other parts that fit to the ends of the motor case. On some models the end bell and handle are now made of pressed steel. The smaller outside dimensions of the steel case and the accompanying decrease in weight contribute to the handiness of these portable tools, without sacrifice of serviceability. On one model the diameter was reduced ¼ in. and the weight cut from 11½ lb. to 9 lb.



The Drill With Drawn Steel Motor Case (at right) Weighs 9 Lb. or 2½ Lb. Less Than the Former Type (shown at left).

These drills are broadly classified as standard and heavy-duty types. On the smaller sizes, that is, up to 5/16 in., the motor case and end bell are in one piece, which consists of a drawn steel shell, 3¼ in. outside diameter and 4⅝ in. deep, made from either No. 20 or No. 22-gage sheets. On larger tools the motor case and end bell are separate pieces cut from standard deep-drawn metal shells of the dimensions given. Tools of various sizes take the same diameter case but the length of the case varies. For some sizes of tools two of the standard shells are used, one from which the stator case is cut and one from which the head or end bell is cut.

The question immediately is raised whether this practice may not be wasteful, because two parts of two cases are discarded in order to assemble one motor shell with an end bell. However, close study of the problem has shown this manufacturer that the practice is sound from the viewpoint of cost. This is because the die cost would run up for the several sets of dies for cases of different dimensions, and there is a further advantage in price in ordering large quantities of one size case rather than small lots of different sizes. Also shop operations are simplified because there is only one set-up with the use of a standardized shell.

Weight of the working parts of the tools are the same regardless of the type of shell or case used. As previously pointed out, the saving in weight comes from the use of pressed metal and also from the reduction in diameter of parts, such as the gear case, which fit to the ends of the shell. On one model the aluminum case weighs 2 lb. 13 oz. and the steel case weighs 1 lb. 4 oz. About ⅜ lb. is saved by the reduction of ¼ in. in the diameter of the gear case casting.

Handles and Other Parts Also of Welded Steel

Drill handles also are made of pressed steel. Each handle is formed of two parts which are welded together and the seam ground to give a smooth surface. End bearing yokes, lugs for attaching the motor stator, lugs for attaching end bell to the motor case and this case to the gear case are all spot welded in place. The handle is spot welded to the end bell or the case, depending on the construction of the tool, and motor end bearings are welded to yokes, or, as in the case of the small tools, to the inside of the case head. Screws are used to assemble the end bell, motor case and the gear case. Drilled and tapped lugs on the gear case match with pressed metal lugs which are spot welded to the motor case. If the end bell is separate from the case tie screws with nuts hold the two parts in place by being passed through spot welded pressed steel lugs.

When both the shell and end bell were castings the following set-ups were required: four screw machine, five milling machine and three drill press; also two tapping

*Resident editor, THE IRON AGE, Chicago.

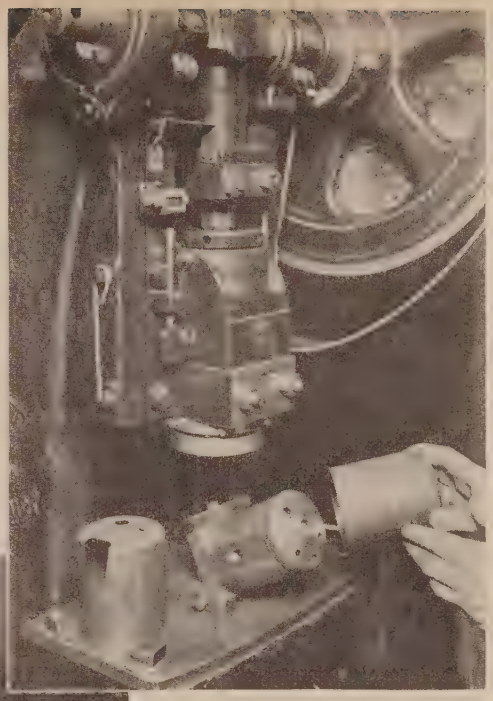
All Attachments, Such as Handles, Junction or Switch Boxes, Bearing Brackets and Screw Lugs, Are of Pressed Steel and Are Spot Welded to the Motor Case

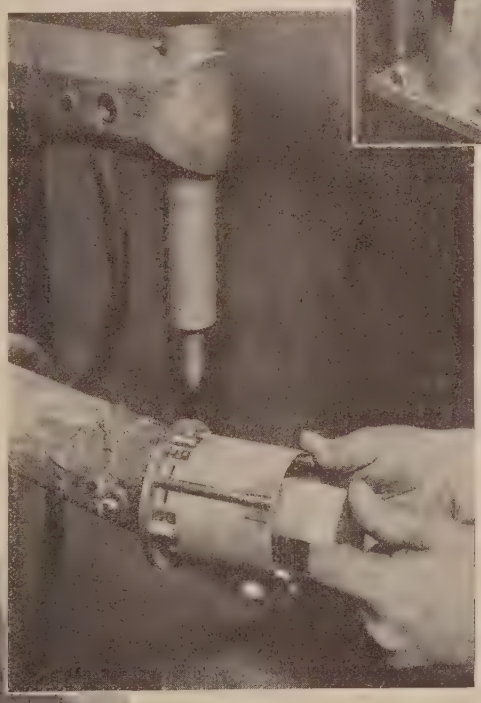
operations. The use of pressed metal calls for eight punch press, three spot welding and two screw machine operations. Equipment previously used was a screw machine, a miller, and an eight-spindle gang drill press. There are now in use a spot welder, a No. 2 punch press and a screw machine.

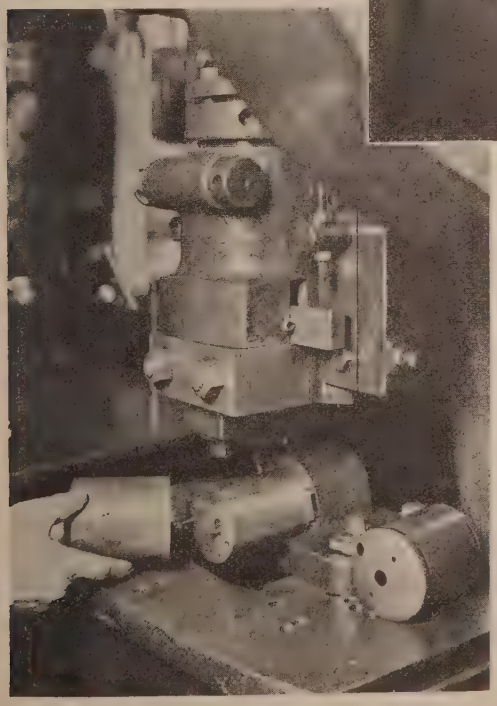
Press and Welding Operations Simple

An idea of the simplicity of punch press and welding operations may be had by reviewing the methods used in making the motor case for a small electric drill. The cases are purchased trimmed to size, and for this size of tool the head and the barrel are not cut apart. The first press operation is punching the holes in the end and, in some cases, a slot which in a subsequent operation is extended to the side of the shell. The lower die for this operation is hinged so that it may be tipped forward as illustrated to receive the steel shell. The die is then tipped back so that its axis is vertical and in line with the center of the punch head. A latch holds the die block to the punch press plate. To remove the finished part the operator releases the latch, tips the die forward and lifts off the shell.

Ventilator slots in the side of the shell are cut in another punch press operation on a cantilever type die block. Two pins inserted in the head of the die serve to properly locate the shell on the die. When the shell is properly seated these pins project through two of the holes which were cut in the end of the shell in the operation already described. The cantilever part of the die is free to rotate. A pin, which is pressed into place by a spring, drops into notches cut in the movable part of the die, thereby serving as a feeler so that after one pair of slots has been cut the operator rotates the die block until he feels the pin drop in the next notch; he then knows the shell is in the right position for cutting the next pair of ventilator slots.







HOLES and Slots Are Punched In the Motor Case Head On a Die Which Tips Forward to Receive the Blank, as Shown Above. The punched holes are used as guides in locating the piece for the second punch-press operation, shown at the lower left. A simple jig (at the left) serves for locating the pressed metal screw lugs which are spot welded to the motor case

All parts that are spot welded are securely held in jigs to assure interchangeability and accuracy. Screw lugs are made of pressed steel and like other assembled steel parts are electrically spot welded in place. The jig for spotting lugs on the shell consists of a flanged collar. The collar is turned so that it fits snugly into the end of the pressed steel motor shell with the flange resting against the end of the shell. Pins mounted in the flange extend along the outside of the shell, as illustrated. The diameter of each pin up to the point where a lug is to be fitted is larger than the opening in the lug. At the exact location of the lug the pin is turned down so the lug will snap over it. The shoulder formed by turning the pin forms a gage for the location of the lug. The pins are of various lengths so that all the lugs at the base and at the top of the shell are properly located before spot welding. After welding, the pressed metal parts are cleaned and lacquered.

"The greatest problem in production is that most uncertain factor, human nature," said Prof. Earle Buckingham, Massachusetts Institute of Technology, in a paper on Quality Control and Production Gages, presented at last week's meeting of mechanical engineers. "The present tendency is to provide equipment that can be operated by semi-skilled labor. Equipment cannot be made altogether fool-proof. The best that can be done is to arrange matters so that little or no excuse remains for making mistakes."

Economic Production Quantities

Utilizing Mathematical Formulas to Determine Lot Sizes in Manufacturing—Simplified Forms Believed Adequate

THREE papers were read before the American Society of Mechanical Engineers on Dec. 5, at the annual meeting in New York, dealing with determination of the economically best production quantity for manufacturing. One of these papers, by C. H. Best, supervisor of materials, Eli Lilly & Co., Indianapolis, dealt with 12 years' experience with the use of a formula for this work. A paper by Robert W. Kent, vice-president, Bigelow, Kent, Willard & Co., Boston, referred to obstacles encountered in introducing mathematical formulas for economic manufacturing quantities. A considerably longer paper by Fairfield E. Raymond, assistant professor of industrial research, Massachusetts Institute of Technology, Cambridge, was entitled "Advantages Derived from the Simplification of the Fundamental Formulas for Economic Production Quantities."

Experience Shows Value of Method

FOR twelve years economic production quantities have governed the sizes of production orders in the plant of Eli Lilly & Co. Mr. Best's paper outlines briefly some of the major results of this practice, both direct and indirect, and discusses some of the cost-accruing problems which were encountered in the derivation of the formulas. The discussion of cost-accounting problems is limited to such problems as might be generally encountered in other plants.

The company manufactures and ships from stock approximately 2400 products, which are marketed in over 8500 different packages. The problem is to maintain stocks of these 8500 items at the lowest possible combined cost of labor of preparation and charges for carrying the merchandise until sold. It was recognized long before 1917 that the quantity produced in a single batch was one of the important factors in determining the cost of producing and carrying the merchandise.

Data were assembled and eventually a mathematical formula was derived for "total cost," as follows:

$$N = 262.8\sqrt{\frac{Y}{M + 202}}$$

where N = economic production quantity in units
Y = number of units sold yearly, and
M = cost of material in cents per unit.

The solution is an easy slide-rule calculation.

During 1917 the production of the plant was handled in 25,633, batches with a labor force of 554. Since 1917 the annual output has very materially increased. In 1928 the increased output was handled in 13,453 batches with a labor force of 482.

Inventory Reduced Considerably

During the past five years the inventory of raw materials has been reduced 21½ per cent by taking advantage of conditions brought about by larger and less frequent batches or runs of staple products. Larger and less frequent batches of staple products suggested scheduling the production of these items in advance, so that raw-material purchases could be scheduled to arrive just in time to meet the production schedules. The average inventory of raw materials in 1928 was $185,000 less than it would have been at the same rate of turnover as was experienced in 1923.

To sum up, economic production quantities have afforded, or have assisted in affording, the following advantages:

1. Considerably more production with 13,453 batches in 1928 than with 25,633 batches in 1917.
2. Considerably more production with a labor force of 482 in 1928 than with one of 554 in 1917.
3. Planning-Department supervision of production at reasonable cost (23 persons, who do certain other work also).
4. Increase in application of mechanical handling of materials.
5. Reduction of 21½ per cent in raw-material inventory.
6. An increase in turnover of finished-stock account from three and two-thirds times a year to four and one-third times.

Executive Must Be Educated

FOR the sake of establishing better manufacturing procedure, Mr. Kent points out methods for determining how much to manufacture of a particular item or part at one time or in one lot. He discusses what is meant by economic manufacturing quantities, the aid toward increasing profits that comes from use of proper formulas, and states that minimum economic manufacturing cost can be obtained only through application of the principles made use of in developing a proper formula to fit each specific case.

Formulas are available which will prove valuable if used. It is true that attempts to understand them may prove discouraging unless one is either very patient or of rather above-average mathematical cleverness. Successful and practical manufacturing executives do not usually develop the nimbleness in transposing concrete facts and experience into abstract formulas necessary to digest rapidly and "become sold on" the practicability of using *x's*, *y's* and *k's* to tell them how much should be manufactured at one time.

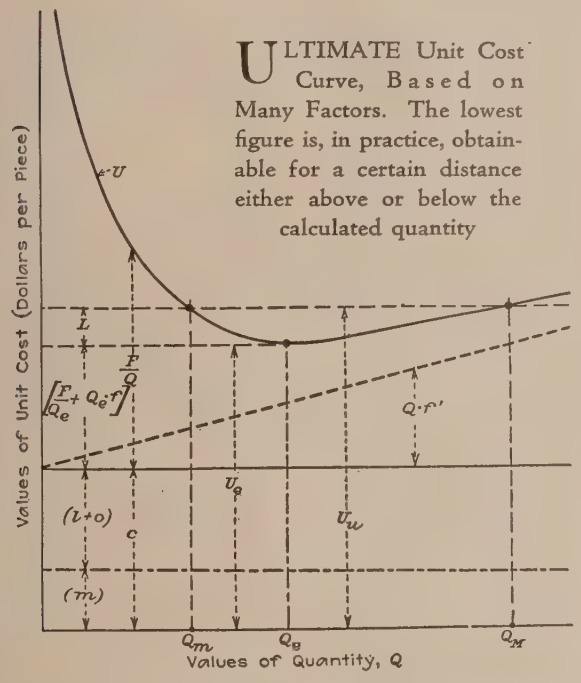
A successful manufacturer is usually apt to fear anything which savors of mystery or magic. Furthermore, anything not readily subject to proof, or anything involving complications of any kind, is apt to hide errors, and factory procedure, to be successful, needs to be as foolproof as possible. Obscurity of any kind reduces foolproofness.

Return Must Be Far Above 6 Per Cent

It is possible that there has not been sufficiently appreciated the extent to which return on capital invested in industry should exceed the return on investment in sound, negotiable securities. It is common for members of the producing phases of industry to think more or less of 6 per cent as a definite interest rate to be used in all calculations they make. But it is probable that return on investment in inventories, equipment, etc., used in industry

might much more properly be figured at 9 to 18 per cent, so that investors in industry may be assured of an added income to warrant their taking the added business risk.

It developed that a very real cause of the necessity for halving or quartering manufacturing quantities as calculated through the use of formulas, in the author's early experience with them, was that too low an interest rate on investment and inventory had been used. The modern economist, as well as the investment banker, in analyzing and diagnosing business situations, more or less accepts as standard the necessity for earning returns in excess of 9 per cent. The risks brought out through the possibility of changes and fluctuations in material prices, obsolescence due to new developments, credit stringencies, or business



ULTIMATE Unit Cost Curve, Based on Many Factors. The lowest figure is, in practice, obtainable for a certain distance either above or below the calculated quantity

depressions of any kind, require that planned returns should frequently be double normal attainable returns on negotiable securities.

Cost of Preparing to Process

Preparation cost, or the cost of making ready the various necessary equipment to run a production order of a given quantity, preparing the necessary forms, handling order through the plant, etc., is one of the most influencing factors in mathematical determination of an economic manufacturing quantity. In making use of mathematical formulas for this purpose it is essential in many cases that entire accounting methods be changed so that total preparatory expense may be correctly determined.

Lots of 1000 units frequently will be found to have been used for manufacturing quantities, for no specific reason. Quantities which will keep factory workers busily employed for one day, or one pay period, seem to be in vogue. Quantities which will constitute a truckload or a trayload also seem to prevail as standards employed in determining size of manufacturing lots. All of these, of course, seem ridiculous in that they present no consideration of the real cost involved nor the effect on cost of difference in the size of lots.

Experience has proved that, if sufficiently careful consideration is given to the particular application of the formula involved, surprising economy may be effected. Occasions have arisen where entire factory management policies were advantageously changed as a result of making use of economic manufacturing quantities.

Evaluating Many Factors

PROFESSOR RAYMOND'S paper seeks to demonstrate that a rapid and reliable method can be developed for application to the problems most frequently encountered in planning production schedules and controlling inventories. This method is stated to be more simple than the fundamental formula developed in the author's 1927 paper on "Economic Production Quantities." Other advantages are gained from the simplified method.

Advantages accruing from the use of Calculation Sheets proposed in the paper, methods of simplification, an approximate solution, elimination of extraordinary factors, consideration of the major elements, determining a coefficient of allowable variation in the data, all are outlined in the paper. A short-cut method for determining the economic production quantity and a study of the losses due to an uneconomic value are given.

Limits of the usefulness of the method are explored and a curve shown, herewith reproduced, for a graphical means of solution. No attempt will be made here to explain the various factors covered in the curve. Suffice it to say that the heavy line traces, for varying quantities, the respective unit costs under a certain set of conditions. The lowest is that at Q_e.

Direct Labor vs. Set-Up Cost

BALANCING up between direct labor cost in production and the preparation or setting-up cost before production begins was stated by Gordon Pennington, consulting industrial engineer, Cleveland, to be the criterion in determining economic production quantities. When there is a change in the ratio between these two items it is necessary to change the formula or to refigure, in determining upon a proper quantity to make of any one lot. When the preparation or set-up cost increases with relation to the direct labor cost, larger batches will be called for.

A simple formula for an economic lot was given by Mr. Pennington as follows:

$$L = \sqrt{\frac{2\ A\ D}{K\ B}}.$$

in which L is the economic lot, A is the preparation cost in dollars, D is the demand in number of pieces yearly, B is the unit cost per piece, not including any part of the preparation cost, and K is the sum of interest, obsolescence, deterioration and storage charges, expressed as a fraction and not as a percentage.

Usually K falls between 0.12 and 0.36. The results from using this equation were said to have as great accuracy as is inherent in any cost accounting system now in general use. As a matter of fact, a difference of as much as 15 per cent in the size of the lot quantity may affect the total unit cost by not over 0.1 per cent.

General formulas for this unit lot, taking account of many factors, have been put forward. One given by Mr. Pennington was as follows:

$$L = \sqrt{\frac{A^2}{B^2} + \frac{AD}{KB}\left(\frac{NP}{NP-D}\right)} - \frac{A}{B}$$

In this expression L, A, D, B and K are the same as before. N is the number of working days in the year, while P is the volume of production in pieces per day.

It is important to establish a reorder point somewhere between the inventory excess and emergency shop orders needed to make up deficiencies. Either of these extremes would result in added costs.

Theory Must Sometimes Be Ignored

Variation in demand for the product introduces serious discrepancies in any such formula, in the opinion of Robert

T. Kent, director of sales and engineering, Divine Brothers Co., Utica, N. Y. He cited a case where, in the same plant, one department was so short of orders that it was difficult to keep a nucleus of the working force busy, while another department at the same time was hard put to it to get out the product, in spite of operating night and day crews.

In such a case it frequently becomes necessary to disregard economic production quantities for both departments. For the one, as it is necessary to keep the organization together if one is to avoid undue expense later in assembling a new organization, production lots will have to be much smaller than the theory would point out as desirable. In the other case, demand for prompt shipment may require the same thing—that is, small production lots, to keep from turning customers away to competitors, even though the theory would call for much larger lots.

At the same time, when conditions permit, as when shipments are asked for by telegraph, the lots could be very much larger than called for by the equation, because then the element of inventory and storage charges would be entirely absent, and the machines could be run over a much larger lot than the equation specifies.

Uses Rotary Foundry Melting Furnace

German Plant Makes Gray Iron and Malleable Castings from Horizontal Cylindrical Shell Fired with Powdered Coal

A FURNACE of unique design, called the Brackelsburg furnace, has recently been put into operation in Germany in the production of high-quality gray and malleable castings. The originality in the design arises chiefly from the fact that the furnace is a horizontal, cylindrical shell, rotating during melting and superheating, and fired with powdered coal. The general features are given in publication No. 131 of the Kaiser Wilhelm Institüt für Eisenforschung, Dusseldorf.

The shell, which is of steel plate, is about 16 ft. in length and 5 ft. in outside diameter. It is lined with fireclay and silica brick and has a capacity of four to five tons. The flame enters one end and leaves at the opposite end, no provision being made at present for recovering waste heat in the stack gases. Charging is effected through the outgoing gas opening. The metal is tapped from an opening on the long side of the furnace.

Rate of Revolution Slow During Melting

Rotation of the furnace is accomplished by a ½-hp. motor. During melting the rate of revolution is comparatively slow, speeding up as the charge becomes liquid. In this way rapid exchange of heat between the "roof" and the metal charge is obtained.

Use of a very hot flame and the possibility of bringing the colder parts of the charge into repeated contact with it result in a short period of melting and only a slight oxidation loss. Owing to the blanket of slag which covers the metal as soon as it is melted, and which is not pulled away by rotation, the contamination of the iron by gas and oxides is very slight.

A comprehensive study, recently completed, deals with the heat and materials balances of two heats of malleable and one of gray. Among other factors studied was the fuel consumption. It was found that for the malleable heats about 13.5 lb. of coal were used per 100 lb. of iron charged, while for the gray iron heat 9.7 lb. were used. This, it is pointed out, compares favorably with any other type of furnace of the same size. The fuel would doubtless be considerably reduced in a large furnace, where equipment for utilizing the heat in waste gases would be available. The metalloid loss is given in an accompanying table:

Table of the Loss of Metalloids

Heat	C	Si	Mn	P	S
Malleable	%	%	%	%	%
Charged	3.31	1.25	0.19	0.068	0.059
Finished	2.82	0.99	0.16	0.072	0.077
Loss	0.49	0.26	0.03	0.004*	0.018*
Malleable					
Charged	3.33	1.25	0.19	0.069	0.063
Finished	2.88	0.87	0.15	0.078	0.057
Loss	0.45	0.38	0.04	0.009*	0.006
Gray					
Charged	2.80	3.62	1.24	0.076	0.023
Finished	2.79	3.28	0.98	0.090	0.028
Loss	0.01	0.34	0.26	0.014*	0.005*

*Gain.

A further conception of the operation of the furnace is given by the accompanying heat balances, which are expressed in per cent on the total heat input.

Table of Heat Balances in Per Cent of Total Heat Input

(A) Input	Malleable	Malleable	Gray
In charge	0.16	0.18	0.05
fuel	96.85	95.17	95.00
metalloid loss	2.99	4.65	4.95
Total	100.00	100.00	100.00
(B) Output			
In iron	31.52	27.31	39.09
slag	2.56	3.73	4.60
waste gas	51.10	55.36	45.05
Incomplete combustion	8.07	2.26	4.35
Dust, evaporation of water, etc.	2.35	3.12	2.79
Unaccounted for	4.40	8.22	4.12
Total	100.00	100.00	100.00

The tonnage melted per hour in the three heats was, respectively, 0.55, 0.46 and 0.60. This could, no doubt, be increased if some use were made of the fifty odd per cent of the heat now passing up the stack.

Savings from Use of Materials-Handling Equipment

Fully 80 per cent of the manufacturing plants not accustomed to the use of material-handling machinery, and particularly overhead machinery in large ways, do not realize the savings effected through the application of these two principles of handling materials. This is the conclusion reached by E. T. Bennington, manager, Cleveland Electric Tramrail Division, Wickliffe, Ohio, in a paper before the American Society of Mechanical Engineers' Akron meeting.

It is true that it is difficult for any engineer to determine definitely just how great these savings will be. It is one of those things for which no definite plans will probably ever be developed for calculating purposes, because of the various conditions encountered in the plants. But it is not difficult to go back, after these principles have been adopted by some manufacturer, and compare the cost under the new scheme of things with that existing before their application.

Aeronautical Aluminum Foundry

All Castings for Several Types of Wright Airplane Engines Made in New Plant—Unusual Daylight and Absence of Fumes

BY FAY LEONE FAUROTE*

IN several respects, the new Wright Aeronautical Corporation foundry in Paterson, N. J., is unique. It has a basement; it is so light and airy that artificial light ordinarily is not needed; there is an almost complete absence of fumes and odors arising from core-making and casting. It is devoted entirely to the manufacture of aluminum castings, except for an occasional bronze or experimental casting called for by the engineering department.

Seven major castings, comprising the important units of the Wright "Whirlwind" and "Cyclone" aeronautical engines, are made of aluminum alloy. Few foundries in the United States are equipped to make such aluminum castings commercially. After attempting to buy them outside, with more or less indifferent success, the Wright engineers concluded that, to obtain castings of their required excellence, it would be necessary for them to install their own foundry, specify their own aluminum alloys, make and bake their own cores, and have all parts and processes under their immediate control and supervision. From the beginning of their commercial manufacture, Wright aluminum engine parts have been made in their own plant. This applies also to the smaller minor parts, as well as those major components mentioned.

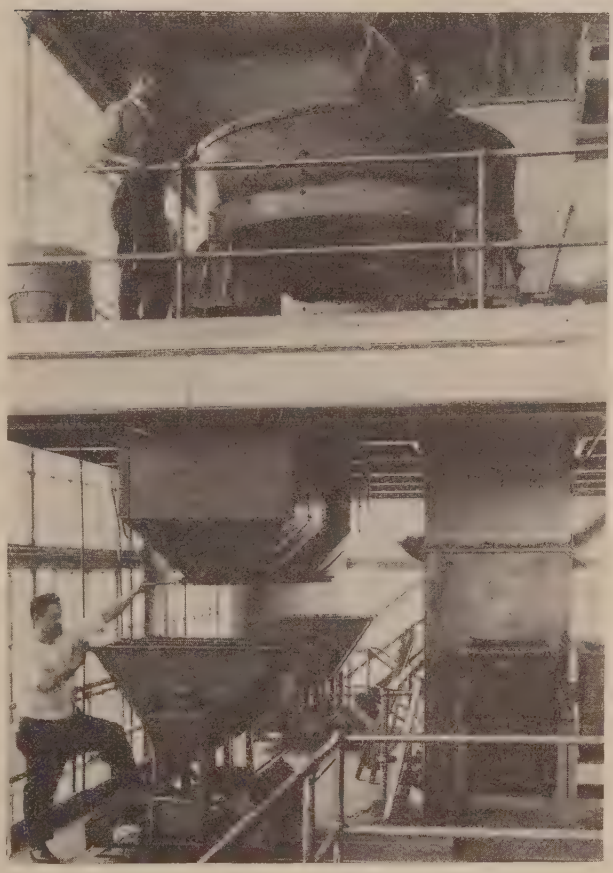
More than a year ago it was apparent even to the casual observer that the former foundry facilities were inadequate. Located on the first floor of the original wing, poorly lighted, cramped in space, it was difficult for even good foundrymen to return a high percentage of sound castings. And so the new foundry, 562 ft. long, 102 ft. wide, has been built of steel, glass, brick and concrete.

Mainly one story high, the building has a three-story section at one end, the second and third stories housing the wood and metal pattern shops. A full basement runs the entire length, and, the main floor being built about 4 ft. above grade, this permits windows in the basement walls. The first floor is of flat slab reinforced concrete construction, and the main story of structural steel, with center bay 40 ft. wide by 26 ft. 7 in. clear height, each side bay being 31 ft. wide with an average height of 17 ft.

Sidewalls are brick to the window sills, with steel sash from there to the roof. These sash have large ventilating elements, and the monitor sash also ventilate. The roof is of reinforced concrete.

Three main sections comprise the main floor. One for core making, one for molding and one for cleaning, heat treating, pickling, inspection, shipping and offices. In this latter section the cleaning department, heat-treating furnaces, pickling, welding and inspection departments are housed, each in a separate room.

Altogether, this new Wright unit adds some 128,000 sq. ft. to the already rapidly growing group recently erected on the original site a few hundred feet away.



Simpson Sand Mixer at Top Mixing Sand With Oil for Making Cores and Molds. Sand is let out left side of mixer, dumped down into conveyors on the next floor and then hauled to the distributing point in the core and mold shop. On the right the square stack is the conveyor or elevator which hauls sand up from storage into mixer

Ample Room for Expansion

Designed by the Wright foundry engineers, the building was erected by the John W. Ferguson Co., Paterson. It is located on a piece of land recently acquired by the Wright company, comprising some 17.4 acres, so there is ample room for future expansion in the 15.6 acres left. At the present rate of growth of the aeronautical industry, it will not be surprising if this foundry capacity, large as it now is, will need to be doubled within the next year or two. At present writing, the foundry is able to take care of 500 engines a month.

It has been pointed out by officials of the Wright foundry that the crankcase castings are especially diffi-

* * * *

CLOSING Seven - Cylinder-Crank-Case Molds (Below) with Aid of Pneumatic Hoist

In the "Whirlwind" series of five-, seven-, and nine-cylinder engines, 94 per cent of the parts are interchangeable, under the new design. But the crankcase sections, of course, owing to the number of cylinders used, cannot be made so. Furthermoore, there are needed the castings for the "Cyclone," the large 525-hp. Wright radial, the new inverted-V Wright engine, the marine power plant and a considerable amount of experimental work which always must be done.

Larger cores, which take much time, are baked in the usual manner in large stationary ovens. But all but the very large ones are loaded on to pendant shelves and carried through the continuous ovens on automatic conveyors. There are three rack-type core ovens in use, also, supplied by the Foundry Equipment Co., Cleveland. Racks of cores are put in and removed by means of an Elwell-Parker electric lift truck.

Baking Cores in Continuous Oven

Most of the cores are made in special core-molding machines. The sand is mixed with oil core compound (containing roughly 80 per cent of linseed oil) and baked or under temperature. The core-baking oven is maintained at 470 deg. Fahr.

While the core conveyor chain is 660 ft. long, only about 250 ft. of it is in the oven. It moves about one foot a minute, and a carrier takes some 11 hr. to make the round trip from loading through oven to unloading, loading and back again.

Conveyor carriers pass down through a row of 25 core

machines, where the cores are made and loaded directly on the carriers by the men making them. This line of conveyor travels on an inclined track, so that empty shelfroom is always available to the various operators along the line, at about the same loading level.

From here the carriers are conveyed through the baking oven. In discharging them from the oven the conveyor takes them to a cooling zone. They are then carried alongside the unloading benches, where the cores are unloaded from the conveyor carriers and then continued through the subsequent process of blacking and pasting. The empty carriers of the continuous conveyor then repass through the loading section as before. The carriers are spaced 6 ft. apart and each carrier handles a load of about 1000 lb of cores and core plates. The system provides a loading surface of approximately 3600 sq. ft. of shelf area each 9½-hr. day.

Oil-burning equipment used for heating the continuous core oven is of the induced draft type. It is mounted directly underneath the oven and is equipped with automatic temperature control. From preliminary estimate, the operation in this oven is to bake 300 lb. of cores on each gallon of oil burned. The oven and dryer has an overall length of 125 ft., width of 14 ft. and height of 14 ft.

Baked cores as unloaded from the conveyor oven are pasted and painted with a blacking, to provide a smooth pouring surface. This paste and blacking finish is baked on to the cores in six direct gas-heated ovens set up in pairs, conveniently located in the core department.

These cores cover practically all of the various parts required in the manufacture of Wright motors, such as fin body, pistons, barrel cores, runner box, crankcase cores and a large variety of smaller parts.

International core machines are used. The core sand, which comes from southern New Jersey, is elevated from the basement to the mezzanine floor in the main building, where it is mixed in a Simpson sand mixer with Woodseed core oil. It is then dropped into four-wheeled hopper cars running on a track on an elevated platform, rolled along as required and dumped into chutes which, in turn, discharge at convenient stations near the core machines. Each hopper car can be dumped at either side; a sheet steel apron, covering the wheels, directs the sand into the head of the chute.

Some of the core sand is used over again, but most of the used sand is shoved through a grating on to a belt which carries it outside the building to a dump cart.

Molding sand comes from the Albany, N. Y., neighborhood. This is of course, after use, reconditioned, aerated and used over again. A Royer sand separator and blender and an Axman sand cutter are employed for reconditioning.

[*A second article will cover the careful heat treatment required in making aluminum aircraft castings and the wood and metal pattern shops.*]

Alloy Steels in the Railroad Field

A PAPER entitled "Alloy Steels in the Railroad Field" was read before the annual meeting of the American Society of Mechanical Engineers by Charles McKnight, International Nickel Co., New York, which hardly covered the ground indicated in the title. The author confined himself to locomotive parts, and while he mentioned many alloys, dwelt particularly upon nickel steels and irons. Considerable space was given to alloy steel castings for side frames, alloy cast iron for cylinders, and nickel steel plate for boilers, all of which have been described at length in THE IRON AGE within recent years.

Much emphasis was properly laid upon the fact that the purchaser of alloy steel should expect to pay at least a cent a pound for "quality"—representing high-grade raw materials and extra care in manufacture—and that old-fashioned carbon steels, when given equivalent attention, are capable of unusually good properties. Mr. McKnight assumed a critical attitude toward "semi-alloy" steels, recommending that analyses with an ample proportion of alloy be selected, but only for places where the best of plain carbon steels are deficient.

In discussion, A. W. Minuse, Central Alloy Steel Corporation, Canton, Ohio, said that a considerable amount of stainless iron (low carbon, 18 per cent chromium alloy) has been used during the last two years for firebox plates and syphons. It does not scale at operating temperature, and its brittle-temperature range is enough higher than that of best quality flange steel that higher pressures can be safely carried in the boiler.

J. R. Campbell, Baldwin Locomotive Works, Philadelphia, recalled that his company's experience on heat treated high carbon and alloy steels dated back at least 25 years, and he was personally acquainted with a fleet of over a dozen locomotives which were built and equipped 15 years ago with forged nickel-chromium steel side rods and pistons. Owing to a combination of good design, good steel, good forging, good heat treatment and careful machining, these parts had given excellent service; reported troubles having been limited to two piston rods. Ten-inch wrist pins on a group of electric locomotives built 14 years ago were made of plain high carbon steel (carbon 0.70 per cent, manganese 0.65 per cent). These were oil quenched and drawn under accurate pyrometric control; test bars gave ultimate strength 140,000 lb. per sq. in.; elastic built, 90,000 lb. per sq. in.; elongation 13 per cent and reduction in area 20 per cent; despite these excellent figures and good impact tests, these wrist pins were unsuccessful. Engines built today are reaching loads of 170,000 lb. on a piston, which in Mr. Campbell's opinion requires a quenched and drawn steel.

G. M. Eaton, Molybdenum Corporation of America, Pittsburgh, said that since wrist pins are subject to rapidly alternating stresses, their failure is frequently due to fatigue. Fatigue or endurance strength of steels appears to be more intimately related to the ultimate strength of the steel than to any of the other tensile properties, but the figures available for designers had all been determined from small samples with polished surfaces. It is known that scratches or lack of well rounded fillets reduce the endurance limit seriously; also that a hot-rolled bar with the mill scale on it may fail under alternating stress at half the loading to be expected. Consequently there was a great need for fatigue tests on full-size machine parts.

Mr. Eaton was confident that plain carbon steels should be used on locomotives wherever it is good enough for the working loads. Especially did he criticize use of case hardened or nitrided materials for essential parts like main pins or axles, calling attention to the well known facility, with which a crack in the hard brittle surface is propagated through the ductile core. If hard wearing surfaces are desired, these should be produced on thin bushings, which can be shrunk on; if they crack it only causes a train delay.

Modern Trends in Alloy Steels

Meeting Demands for Better Rails—Tests on a Chromium Rail—Modern Cutting Tools Compared—What Constitutes an Alloy Steel

LAST February, at the annual meeting of the American Institute of Mining and Metallurgical Engineers, the James Douglas Medal was awarded to Dr. Paul D. Merica, director of research, International Nickel Co., New York. Because of a protracted illness, Dr. Merica was unable to be present to receive the medal at the annual banquet of the institute at the Waldorf-Astoria Hotel, Feb. 20. (THE IRON AGE, Feb. 28, page 608.) It was announced, however, that the medal would be publicly presented at some future date.

Douglas Medal Presented to Dr. Merica

On Wednesday evening, Dec. 4, at a meeting of the New York Section of the institute, the medal was formally presented to Dr. Merica. The presentation and technical session which followed were preceded by a dinner at the club rooms of the Building Trades Employers' Association, 2 Park Avenue, New York. Immediately following the dinner, Stanislaus Skowronski, research chemist, Raritan Copper Works, Perth Amboy, N. J., chairman of the institute of metals division, formally notified Dr. Merica of the award of the medal.

In an appropriate speech Dr. Merica accepted the honor, dwelling briefly upon the fact that three of the six recipients of the medal since 1923 are members of the institute of metals division, and calling attention particularly to the fact that investigations in this field are divided primarily into two divisions—the extraction of the metal from the ores and the industrial applications of the metals in general. He emphasized the obstacles involved in finding applications, especially new ones, for certain metals and pointed out that this work is even more difficult than the extraction of the metals.

Recent Developments in Alloy Steels

FOLLOWING the presentation of the medal, C. E. MacQuigg, director Union Carbide & Carbon Research Laboratories, Inc., Long Island City, N. Y., delivered an address on "Recent Developments in Applications of Steels," followed by some discussion by a few of the hundred or so metallurgists present.

In general Mr. MacQuigg's discussion embraced only the alloy steels. Plain carbon steels have not made any new departure in composition in recent years, although there are many interesting expansions in their application, said Mr. MacQuigg. In 1928 of the 51,544,180 gross tons of all kinds of steel produced, 3,214,909 tons, or 6.2 per cent, was alloy steel, according to the data of the American Iron and Steel Institute. The whole story of steel has been one of constant progress, a consistent effort to meet the ever-increasing demands for enhanced properties. An example, taken from the experience of ordnance makers, is typical—shells to pierce the invulnerable armor and then armor to withstand the armor-piercing shell. At present, the shells seem to have it.

After discussing the progress which has been made in the application of steel in bridges and pointing out how the tensile strength in the latest bridge involves steels having strengths of 225,000 lb. per sq. in., the speaker dwelt briefly on rail steels in which field a jacking-up process has also been applied to the physical properties. This is because unit stresses are being raised, due to the ever-increasing wheel loads. This has led not only to an increase in the weight of the rail section, but to the marked raising of the carbon content to make a stronger and stiffer rail.

Inasmuch as rails may at times develop unit stresses of between 50,000 and 100,000 lb. per sq. in., the trial of alloy steel is not an illogical step. Heat treatment of the plain carbon steel rail is also being developed. In regard to the 13 per cent manganese rail, Mr. MacQuigg pointed out that this metal exhibits extreme resistance to wear when severely punished by pounding and shock, coupled with unusual toughness. The rail, however, is expensive and, since the disposal of scrap is a serious question, the use is restricted. Following the satisfactory results obtained by medium high-manganese steel for forgings, the medium-manganese rail has been developed. Its use has expanded notably in the past few years, the annual consumption by one system alone having risen from 50,000 to 80,000 tons in three years.

One factor in connection with the development of better steels for rails is that conditions are changing to such an extent that the exact requirements for the ideal material cannot be determined. One developed line of attack is to increase greatly the elastic limit of the steel, rather begging the question of ductility on the supposition that rail failures, other than wear, are resulting from excessive deformation, these, in turn, leading to the development of internal flaws.

Chromium Steel Rails Stand Tests

The speaker then referred to some work recently done on a 3 per cent chromium low-carbon steel rail. The idea is to make use of the high wear-resisting and air-hardening properties of such steel. Such a composition, it was argued, would give a dense, small grain in the center of the rail head, plus high tensile strength and wear resistance due to the chromium content. At the same time ease of machinability, as well as toughness and ductility, would be assured by the low carbon. Drop tests on these rails, using a 2000-lb. tup with 22-ft. drop, have shown that they possess greater stiffness and better distributed ductility than the plain carbon or medium-manganese steel rails of smaller section. Slides were shown of the Brinell hardness of the sections as cooled on the hot bed; these were in the neighborhood of 360 to 390. In spite of these high hardness values, said Mr. MacQuigg, the rail machines with ease and the drop tests were surprising in the number of blows required to break the sections. Final decision, however, must await rail tests in service.

The speaker alluded to a recent report on the behavior of a high-chromium rail steel in England, which is decidedly favorable. The rails contain about 1 per cent chromium with carbon about 0.50 per cent, manganese 0.80 per cent and silicon 0.20 per cent. Wear resistance of these rails has been exceedingly good.

Elimination of transverse fissures may not be expected to result from the use of alloys if, as seems to be the present consensus of opinion, they originate in the process of manufacture. Alloys will only add strength, toughness

or resistance to wear, and under some conditions may require better manufacturing technique.

Stronger Steels for Airplanes

DISCUSSING steels for dynamic use, as contrasted with those for static use, Mr. MacQuigg reviewed the substitution of metal for wood in airplanes, stating that the latest step is the use of sheet metal for fabric and that the day of the all-metal plane has already arrived —at least for the larger units. There is an increasing demand for high-tensile wire for airplanes. Where construction permits, very high unit stresses may be carried and high tensile strength can be developed by wire drawing. This will be used in the absence of stresses of compression or bending. Chromium-molybdenum steel is being largely used today in the joints of aircraft frames and in the fuselage itself, this steel having been selected because of its toughness and partly on account of its reliability under heat treatment.

Improvements Made in Cutting Tools

REFERRING to cutting tools, increased production per unit of labor time is brought about by cooperation of the metallurgist and the machine tool builder. The metallurgist's duty is to produce a tool that can do more work than its predecessor and the engineer must then build machine tools that can take advantage of this increase in ability. Cutting tools in general use are made of plain carbon steel, high-speed steel and Haynes stellite. When each of these tools was introduced it was a great improvement upon those in existence and each has contributed greatly to industrial developments.

By the use of Haynes stellite tools, it is now common practice to fully machine cylinder blocks at a cost of $1.13 for direct labor, this charge including all of the work necessary to make the rough casting ready to be placed in the motor assembly line.

High-Speed Steel 20,000,000 Lb. Annually

It is estimated that about 20,000,000 lb. of high-speed steel is produced annually, with the following distribution: Twist drills, reamers, counterbores and formed tools of that type, 30 per cent; cutters, hobs, mills and formed tools of similar type, 25 per cent; disks, punches, etc., 15 per cent; turning tools for lathes, for planers, shapers and boring tools, etc., 20 per cent; with other uses totaling 10 per cent. It is estimated that $200,000,000 a year is saved by the use of high-speed steels in the manufacture of automobiles alone. This represents only actual savings due to decreased machining expense and does not take into account savings resulting from decreased costs of additional machines and other facilities. It has been estimated that less than $1,000,000 in tungsten for high-speed steel saves from two to three billion dollars annually.

Haynes stellite, however, has not and never will displace high-speed steel which, in turn, did not displace carbon tool steel, each having a field in which it is superior to the others. The field for stellite is that of machining cast iron and for turning steel under fairly rigid conditions. The greatest field for high-speed steel tools today is the turning of steel parts on full automatic and semi-automatic machines. Plain carbon steel tools find their most valuable application for some kinds of finishing work and various turning jobs.

Effect of Tungsten Carbide Tools

Referring to the latest developments in this line, tungsten-carbide tools, the speaker said that during the past two years tools of this kind have been given more or less extensive trials by several manufacturers. Owing to their high mineral hardness, which lies between corundum and diamond on the scale, these tools will machine products which have heretofore been considered unmachinable, such as glass, porcelain, fiber, manganese steel and hardened steels. It seems that they will probably be very successful for the turning of cast or chilled iron, on which kind of work they will have a life long enough to justify their high cost. It is also probable that machine tools will be built that will enable the manufacturer to take advantage of the fact that they can be run at higher speeds, thus resulting in still lower labor costs per unit of product. Their general utility for turning and cutting steel is at this time not so well assured, said Mr. MacQuigg.

These tools, however, offer the possibility of a distinct and definite change in the types of steels used for certain particular purposes. If it should prove feasible to use them for turning, milling and drilling harder steels than can be handled by present practices, it will be possible for the manufacturer of automobiles and other machines to use harder, and consequently stronger, steels for parts subject to heavy stresses. Such parts as crankshafts would be hardened, but would still be machinable with these tools. This opens up the possibility of using lighter sections and securing all the indirect advantages which would usually result from a decrease in the weight of moving parts.

About 25,000 *Tons of High-Chromium Steel Made Each Year*

DISCUSSING the field of high-chromium corrosion-resistant steels, it is estimated that the total annual production is about 25,000 tons. The largest expansion is probably taking place in the fields of chemical technology and the food industry. These steels are, however, being used by the metallurgical and mining industries as well as by the petroleum engineer in his processes for oil cracking. One installation of a high-chromium nickel alloy alone will amount to several hundred thousand dollars in an ore-leaching process where the question of difficulty of replacements in an isolated situation very greatly outweighs considerations of first costs.

Locomotives Largest Field for Alloy Steels

In the discussion which ensued, Charles McKnight, metallurgist, International Nickel Co., New York, took some exceptions to the statement of the speaker regarding plain carbon steels. When alloy steel first appeared about 20 years ago, there was much difficulty in making a satisfactory product. As the technique and process improved, there was a corresponding enhancement of the quality of plain carbon steels and today these are of a much higher grade than they formerly were. The largest future use of alloy steels will be in the locomotive field, said Mr. McKnight. There is a constantly increasing use of these steels in forgings and castings incorporated in locomotives as well as in the boilers themselves.

In the 15 years before the war, when he was engaged in constructing copper smelters in the West, E. E. Thum, THE IRON AGE, New York, said that the various grades of steel which were available were decidedly limited. He vividly contrasted the situation today when numerous alloy steels of varied composition can be selected to accomplish difficult undertakings which greatly simplify the problems of the metallurgist and the engineer.

A Definition for Alloy Steels

Calling attention to the fact that we are dependent entirely upon the statistics gathered by the American Iron and Steel Institute as to the output of alloy steels, E. F. Cone, THE IRON AGE, New York, stated that there is no clear understanding of just what an alloy steel is and the statistics do not fully reflect the entire production. The statement of Mr. MacQuigg that copper-bearing steel is regarded in his discussion as an alloy steel is interesting. The statistics of the institute do not include the medium-manganese rail steel, of which a large quantity is made

each year. In some quarters it is contended that a true alloy steel is one which contains as a minimum 0.50 per cent of the alloying element. If this definition were accepted, it would rule out several of the important steels, such as carbon-vanadium and carbon-molybdenum steels and copper-bearing steels, all of which are now regular products. He also pointed out the confusion concerning the nomenclature of the high-chromium and the high-chromium nickel steels, a situation which certainly should be clarified.

Dr. F. M. Becket, vice-president, Union Carbide & Carbon Corporation, New York, could not agree to the statement that 0.50 per cent should limit the quantity of the alloying element for defining an alloy steel. He quoted a definition which he considered as excellent; namely, that an alloy steel is a plain carbon steel in which the addition of an alloying metal changes the properties of the steel. Asked as to whether he meant by this physical and chemical properties, such as non-corrosive qualities, he said that he would include both.

Effect of Composition on Hardness of Tungsten Steels

VARIOUS divergent results arising during the making and treating of tungsten steels led W. Zieler, *Stahl und Eisen*, 49 (1929), pages 1083 to 1084, to determine the effect of composition and drawing temperature on the hardness values.

Annealing and cooling are of primary importance in the formation of carbides in this system. Thus in the intermediate and higher tungsten steels, normal cooling favors the formation of a double carbide. With longer time near the critical temperature and slower cooling, this double carbide tends to split off more or less WC. However, small additions of chromium tend to prevent the decomposition and the splitting off of WC.

In tungsten steels the phases present may be classified as—Fe_3C, Fe_2W, WC, and two double carbides (known as Z_1— and Z_2—carbide). In the lower carbon ranges, the Fe_2W is stable, yielding, as the carbon increases, to the double carbides. WC appears as the stable component, unaffected by annealing, in the higher carbon steels.

Although the original results are given in the form of a space model, a few data tabulated below will serve to illustrate, in the general, the findings:

Series with 0.3 *Per Cent C—Oil-Hardened.*

W, per cent (approx.)	0	1	5	10	15	20
Best Brinell hardness.	311	311	425	343	401	321
Drawing temp., deg. C.	1200	1250	1050	1150	1250	1200

Same—Water-Hardened.

W, per cent.....	0	1	5	10	15	20
Brinell	447	495	506	290	262	212
Temp., deg. C.....	880	900	900	880	900	820–900

Series with 0.7 *Per Cent C; Oil-Hardened; Normal Si. Content.*

W, per cent.....	0	1	5	10	15	20
Hardness	305	712	627	653	627	627
Temp., deg. C.....	950	850	1000	1000	1000	1100–1300

Same but with 0.5—0.9 *Per Cent Si.*

W, per cent.....	0	1	5	10	15	20
Hardness	305	550	630	534	500	510

In no case could as high a degree of hardness be obtained with high-silicon contents as with low.

Series with 1.1 *Per Cent C; Oil-Hardened.*

W, per cent.....	0	1	5	10	15	20
Brinell	578	555	601	601	601	653
Temp., deg. C.....	1250	1250	950	1050	1050	1050

Series with 1.4 *Per Cent C; Oil-Hardened.*

W, per cent.....	0	1	5	10	15	20
Brinell	534	534	601	682	712	712
Temp., deg. C.....	900	800	850	800	750 to 950	750 to 1100

Worthy of mention, in the case of the higher tungsten steels, is the attainment of a good hardness at low temperatures (750-800 deg. C.) as well as a large hardening range. The figures given represent the best hardness values obtained for each steel with the corresponding temperature.

Limit of Carbon Content Determined by Forging Properties

Further study showed that the hardness was retained above 23 per cent tungsten and with carbon contents as high as 0.07 per cent for each per cent of tungsten (or 1.61 per cent C. with 23 per cent tungsten). In general, the upper limit of carbon content is determined by the forging properties.

In order to test out one of the steels, the last-named one above (20 per cent W, 1.4 per cent C) was used to cut a chill-cast roll, which exhibited about 50,000 lb. a sq. in. tensile strength. Against this material the tool stood up for 1½ hr., cutting at the rate of about 13 ft. a min. with an 0.008-in. feed and an 0.01-in. chip. Further improvement was noted on the addition to the alloy of 0.6—0.7 per cent Cr.

Large Trailers Minimize Quantity-Delivery Costs

WITH the aim of minimizing costs, the Atlas Steel Barrel Corporation, Bayonne, N. J., is using six-ton capacity trailers drawn by 2½-ton motor trucks for making large-quantity deliveries in territory near its plant. The particular outfit illustrated is loaded with 268 50-gal. steel drums. The overall length of the trailer and truck is 51 ft., while the maximum width is 8 ft. and the height 11½ ft. The trailer was supplied by the Lapeer Semi-Trailer Co., Long Island City, N. Y., and the truck by the Mack International Motor Truck Corporation, Jersey City, N. J.

Aircraft Problems Discussed

Engine Production Facilities Now in Excess of Demand—Situation Favors Improvements in Product

IN a paper on "Recent Developments in Aircraft Engines," contributed to the fiftieth annual meeting of the American Society of Mechanical Engineers in New York last week, John H. Geisse, vice-president of engineering, Comet Engine Corporation, Madison, Wis., outlined briefly the status of production facilities and some of the recent technical developments.

"The most noteworthy event of the last year or two has been the number of new concerns that have entered or have become closely affiliated with this field and the tremendous expansion of production facilities on the part of the older companies," he said. "Outstanding among the new ones may be mentioned such well-known companies as the Continental Motors Corporation, Lycoming, E. W. Bliss Co., Le Blond, and the author's associates, the Gisholt Machine Co.

"Before considering the products of these companies, it will be interesting to look into the possible market for their wares. A little over a year ago there was a definite shortage of engines. The stock of war-surplus engines was rapidly dwindling, and with the increased demand the production facilities of the country were not equal to meeting the situation. This curtailed the production of planes, and the market was quite definitely a sellers' market. Under this condition it was quite easy, and perhaps quite natural, for the plane manufacturers to make rather broad statements of the number of planes they could sell if only they could secure the engines.

Probable Sales Less Than 7000

"The existing engine manufacturers, and many others who were not then manufacturing, were influenced by these optimistic statements and immediately took steps to provide against another shortage this year. How admirably they succeeded is evidenced by the fact that present production facilities far exceed any possible demand. Whereas the year started with plane sales predicted to exceed 14,000, the latest estimates place the probable year's sales at less than one-half of this figure. The actual engine production for the first six months of this year as reported by the Aeronautical Chamber of Commerce was 3275, and it is doubted whether this figure will be greatly exceeded in the present period. If it is doubled in this period, it will mean a production rate of not over 40 engines per day. In contrast to this it is very easy to total up claimed production facilities of over 100 per day, and each day brings news of new enterprises, all planning on going into production, at the rate of ten per day.

"It is not desired to paint a gloomy picture for the industry, but the author does want to impress the fact that there is no shortage in production facilities for the time being, and that there is not likely to be another shortage in the immediate future. He confidently expects the industry to have a phenomenal growth and that the demand will catch up to production facilities, if the growth of the latter only will slow down to a saner rate.

"This rush to get into production has, to a considerable extent, held back engine development during the last year. Now that production facilities exceed the demand, developments will come along more rapidly. Not only will the engineers have more time to concentrate on improvements in their products, but competition will demand them."

The trend toward the "in-line" air-cooled types of engines was briefly discussed, as well as some of the advantages and disadvantages of the radial engine. Of the latter it was said that undoubtedly it will continue to be used by many manufacturers.

Cylinder construction comprising a steel sleeve having machined cooling fins and a cast-aluminum head screwed and shrunk on the sleeve was said to be almost general practice. In most cases the heads are cast of Y-alloy which retains a relatively high strength at elevated temperatures, giving about 26,000 lb. per sq. in. at 500 deg. Fahr.

Cylinders are generally machined from a 1050 S.A.E. heat-treated forging. "A new development of this year," said Mr. Geisse, "is the elimination of normalizing, and the re-heat treating of cylinder forgings. One prominent manufacturer is now securing his cylinder forgings with one heat treatment, which gives the desired Brinell hardness, but leaves a very coarse grain structure. The saving in heat-treatment cost is not very great, but the material in this condition is very much easier to machine than when normalized and re-heat treated to give the same Brinell hardness."

Heat-Treated Alloys for Crankcase

There was said to be a general trend toward the use of heat-treated alloys for the crankcase. The tensile strength of these alloys is from 30,000 to 40,000 lb. per sq. in., in the heat-treated condition as compared to about 20,000 lb. obtained from the more common No. 12 alloy. "Because of the limitations imposed by casting difficulties on minimum wall thickness and to the variations in wall thickness in the usual castings, which may adversely affect the heat treatment, all of this gain in strength cannot be utilized for weight reduction," said Mr. Geisse. "These considerations, along with the higher price of the castings, make the use of these alloys questionable in many cases. Use of forged crankcases is still limited, it is believed, to Pratt & Whitney. Curtiss is using some magnesium castings, which permit a considerable saving in weight where strength is not required, but which are expensive."

Written discussion submitted by Robert Insley, vice-president Continental Aircraft Engine Co., Detroit, included the elimination of normalizing and re-heat treatment of cylinder barrel forgings. The author of the paper, it was pointed out, makes no comment on the effect of this process on physical properties. "Unquestionably this shortened process saves a few cents per forging, but it also definitely reduces the strength and wear resistance of the material," said Mr. Insley. Regarding the advisability of heat-treated aluminum castings for crankcases, Mr. Insley said: "It is true that in the unstressed wall sections the minimum thickness required for good casting properties affords sufficient strength in un-heat treated castings. In highly stressed parts, such as mounting bolt lugs, cylinder flanges, etc., the saving in weight possible in the heat-treated casting will well repay the slight additional cost."

In reference to the use of magnesium alloy castings, he pointed out that "the strength of the cast magnesium alloy is distinctly better than common aluminum casting alloys, approximately the same as the Y-alloy, and that the elongation is nearly twice that of the best aluminum alloy used for aircraft engine parts. The cost, piece for piece, is approximately 25 per cent higher than aluminum, which, together with the susceptibility to corrosion, has restricted use of this material."

Large Airplanes for Transportation

At the same session, which was held Dec. 6 under the auspices of the A.S.M.E. aeronautical division and presided over by C. H. Colvin, Pioneer Instrument Co., Brooklyn, N. Y., C. T. Porter, vice-president Keystone Aircraft Corporation, Bristol, Pa., presented a paper on "Factors in the Design of Commercial Airplanes."

An increasing market for air transportation, using the equipment as now developed, was said to lie in the more remote and inaccessible places where quick and cheap boat and rail transportation has not yet been provided. "However, this type of market will not supply the demand that the industry needs, and the aeronautical engineer must produce a product that can equal the speed, cost and comfort of the extra fare train," said Mr. Talbot.

"To be successful in competition with the extra fare trains the airplane designer must supply a combination of speed and comfort that will be sufficiently more appealing to the general public to justify the higher cost of air transport. With increase in the number of landing fields and improvement in airplane efficiency, there is no doubt that air transportation will play a prominent part in the economic life of the country."

Can Business Balance Be Attained?

Economic Equilibrium, Mergers, Optimum Size of Organization and Satiability of Consumer Demand Are Discussed at Taylor Society Meeting

INDUSTRIAL equilibrium, a subject that is now challenging the best brains of Government and business, was a leading topic at the annual meeting of the Taylor Society, held at Hotel Pennsylvania, New York, Dec. 4, 5 and 6. Mergers, the optimum size of organization, the preservation of individual initiative in large companies, controllable factors in management and the satiability of consumer demand were other questions discussed —all of them inspired by the report of the Hoover Committee on Recent Economic Changes.

Briefly, the purpose of the meeting was to interpret findings of the report both from the standpoint of its broad application to the problem attacked by the Washington conferences and from the angle of their bearing on the managerial policies of individual industries.

Are there practicable steps toward an industrial equilibrium? This question, thanks to President Hoover's conferences, is uppermost in the minds of the American people at the present time. Many are disposed to doubt the feasibility of current efforts to promote economic balance, lacking faith in what they call "palliatives" or "artificial stimulants," but others take a more hopeful view, although frankly admitting that the undertaking is an experiment.

No question could have been more timely for consideration by the Taylor Society and no more appropriate speaker could have been selected than Prof. Wesley C. Mitchell, director of the National Bureau of Economic Research, which prepared the fact-finding portion of the report on Recent Economic Changes.

Cites Progress Made Toward Stable Economy

PRACTICABLE steps toward equilibrium can be taken, Professor Mitchell believes, stating that various measures have already been tried to make the business engine run more evenly, as brought out in the report that he helped prepare. "Also I recognize that a further step of great technical interest is being tried at this moment on a national scale," he added. "While a business cycle is passing over from the phase of expansion to the phase of contraction, the President of the United States is organizing the economic forces of the country to check the threatened decline at the start, if possible. A more significant experiment in the technique of balance could not be devised.

"But whatever measure of success may attend President Hoover's effort, further steps toward industrial equilibrium must be taken in the future."

Professor Mitchell explained that equilibrium is not a static condition, but that throughout the complicated business dealings going on at any time there runs a gravitational pull toward balance. Equilibrium constantly tends to establish itself afresh whenever departures from it occur. But departures are to be expected and the abolition of such disturbances might check progress in per capita production and consumption.

"We attribute a great part of the mechanical progress of the last hundred years to the pressure which those who early adopted superior methods applied to their slower moving competitors," he said. "The desideratum seems to be a technique of balance which will permit cumulative changes, each of which disturbs existing arrangements enough to secure the prompt adoption of improvements and keep everybody on his mettle, but a technique which will prevent these salutary irritants from developing into cancers.

"In other words, the aim is to reduce random, seasonal and cyclical fluctuations in economic activity, so far as that can be done without checking the rise of secular trends."

Gratifying progress in that direction has been made of late, according to Professor Mitchell. "The half-dozen years preceding 1929 combined moderation of cyclical fluctuations with acceleration in the rate at which per capita income grew. Doubtless circumstances which no man planned contributed to this outcome, but part of the result was due to human contrivance. Nor does any reason appear why, by the continued exercise of their inventive powers, men may not better the accomplishments of 1923-1928."

Rapid Liquidation Accelerated Recovery from 1921

THE bearing of industrial equilibrium on regularity of operations and of employment was the subject of a paper by Leo Wolman, member of the faculty of the New School for Social Research, New York, and also on the research staff of the National Bureau of Economic Research.

"If there is anything to the notion of balance and equilibrium," declared Mr. Wolman, "then the problem of securing industrial stability and regular employment consists in the early discovery of excesses in the industrial system and in the application of measures of control. In principle such a procedure may appear simple; in practice it is surrounded with unusual difficulties—difficulties of fact and of analysis.

"It is not so long ago since disturbances in the economic system were regarded as self-corrective. The interesting question now is whether we have passed much beyond that stage; and the answer to the question seems to lie in our capacity to analyze the experience of the recent past. . . .

"While many factors no doubt contributed to the swift and unexpected turn of American business after the deep depression of 1920 and 1921, the single and most effective force was, in my judgment, the speed and completeness of the business and industrial liquidation of those years. . . . In place of a hesitant and prolonged adjustment of costs to a new condition, such as has characterized the history of the past 10 years of English industry, the American adjustment was drastic and decisive. What happened here was probably not the result of deliberate policy, but was due to the prevailing temper of the country manifested in an unusual mobility of both capital and labor.

"This fact of mobility or of elasticity which seems to me to be central in accounting for both the recovery of business and for the maintenance of high levels, once they have been achieved, has persisted in the subsequent post-war years. If anything its force has been enhanced. The rising general level of education in the country, the progressive mechanization of industry, the experi-

mental attitude of the industrial engineers and of the managers of industry, the cumulative application of invention, and the preoccupation of industry with the improvement of plant and equipment, have been the factors that have combined to accelerate the pace of our industry and to perpetuate the habit of frequent and universal change.

Automotive and Building Industries Were Stimulants

"ASSOCIATED with this pervasive, psychological attribute of our contemporary business situation are features that may well turn out to be more fundamental. . . . Of these the most significant appear to be the state of the efficiency of industry, the direction of the price level, the credit condition of the country, and the probabilities of further growth in the size of the market."

Mr. Wolman points out that since 1919 American industry has been characterized by a reduction in costs as a result of improved methods of management and invention. But the most striking changes in productivity took place largely in the so-called new industries—the automobile and collateral industries, the electrical and chemical industries. A question of great moment at present is whether these industries have reached a stage of retardation in which, for the time being at least, no further progressive reduction in costs can be looked for.

The construction industry has also been an important contributor to prosperity in the last eight years. If both construction and the automobile industries have "reached the end of their rope," Mr. Wolman believes that "we must depend for an accelerated pace upon the performance of some unknown new industry or upon technical revolutions in the old, established ones."

Although it seems impossible to explain what happened in terms of reduced costs in the building industry (Mr. Wolman adds that improvement on that score may have been greater than is realized), a downward movement of the price level at this juncture, if unaccompanied by further cost reduction, may "produce those consequences in shrinking profits that are often associated with the existence of industrial depression."

New Stimulus Must Be Found

In appraising the activity of recent years Mr. Wolman suggests that the use of consumers' credit in developing the automobile, radio and similar industries may prove to have been a species of slow, but effective, inflation. Likewise the financing of building construction during the boom years 1925 to 1928 may have been marked by inflationary practices.

When for such or other reasons important industries slacken, "the existing economy," Mr. Wolman says, "must look elsewhere for a new stimulus. The creation of this type of incentive to business is the purpose of the conferences now being held in Washington and it may very well happen, within the next months, that the spur to business will come either out of the deliberations in Washington or from the discovery by a single industry of a new product or a variant of an old one."

See Greater Economic Coordination Ahead

"WE are challenged to control a billion horses more or less wild," declared Stuart Chase, Labor Bureau, New York, in picturing the problem of attaining industrial equilibrium. Pointing out that at least a billion horsepower has been loosed on the world since the day of James Watt, he declared that the greatest question facing us is, "Have we the intelligence collectively to control the machine age?"

It is conceivable that coordinated control is possible in a dictatorship like those in Italy or Russia, he said, but it is manifestly difficult of achievement in the United States with its system of free competition, "more or less diluted by mergers, to be sure."

Although admitting that the standard of living in Russia is still far below that in America, Mr. Chase suggested that there might still be some lessons for us in the Soviet experience. He related what he had learned in Russia about the Soviet program for the development of its economy. All industrial expansion is in the hands of a general economic staff. The Donetz coal basin and the Caucasus oil region are being exploited as single economic units. Overexpansion and wasteful methods of production can be and are avoided.

Available surplus capital in Russia is invested where careful study indicates that it is most needed. The first objective of the Soviet authorities was to bring industrial production back to the pre-war level by 1927. This goal was reached. The Government now has a five-year program to double production, at the same time reducing unit costs 35 per cent. For the first year (fiscal year ended October, 1929) the plan called for a 21 per cent increase in industrial production. The actual gain, said Mr. Chase, was 24.3 per cent.

In Russia's present program the accent is on producers' goods, particularly the building of steel plants and electric generating stations; just enough consumers' goods are being released to hold popular discontent in check. The Russian experiment in coordination, Mr. Chase added, is getting aid from this country in both equipment and technical personnel.

Believing that President Hoover has already inaugurated what is an approach to an economic general staff, Mr. Chase suggested that such a central body assisted by regional economic staffs—all of them purely advisory—might prove adapted to the needs of this country. Plans could be laid out for each region with an eye to the conservation of natural resources, and advice could be given on the use of capital, thereby discouraging the overbuilding of plants as well as the expansion of others to meet actual needs. The use of credit, industrial decentralization, the pooling of extraordinary advances in the science of management, and the handling of technological unemployment would also be matters that could properly come within the scope of the work of such bodies, Mr. Chase said.

Statistics as an Aid to Equilibrium

ANOTHER plea for greater coordination, though of a different kind, was made by Prof. J. T. Madden, New York University. He pointed out that there are many independent Government fact-finding agencies whose efforts might be made more effective if pooled. Many facts uncovered, moreover, lack utility because they are not made available or are too incomplete. The statistics that offer the greatest possibilities, in Professor Madden's opinion, are the income tax returns. If complete returns were made available for study a year after collection, they would greatly help business men in controlling business. They would indicate the profitableness of undertakings, and trends and tendencies in different lines of industry. If in addition information could be obtained on units sold, units produced, units in inventory, number of men employed, number of man-hours involved and wages paid, even more intelligent analysis would be possible. The additional burden of supplying such data might stir up some opposition, although Professor Madden was confident that it would not be insuperable, declaring that the significant thing about the American business man is that he is willing to try something new if he sees a possible benefit from it.

Professor Madden's suggestion, together with other proposals, were embodied in a resolution adopted by the Taylor Society for consideration by the President's conference. The resolution is published elsewhere.

A third discusser of the papers by Messrs. Mitchell and Wolman was Dr. Leonard Kuvin, chief statistician, Index Number Institute, New Haven, Conn. In his view the chief obstacle to industrial equilibrium is the present distribution of income. Funds that should reach the pockets of labor to nourish consumer demand are plowed back into unused plant and equipment.

Buying Power May Not Continue to Rise

THERE is nothing automatic about the gain in popular buying power, such as has characterized recent times, declared George Soule, associate editor, *New Republic*, speaking in another session. A further increase cannot be relied upon. In fact, the problem of mass purchasing power, in Mr. Soule's opinion, is one of the greatest uncertainties of our economic future in the next decade or two. It is a serious question,

he thinks, whether employers have consciously adopted the so-called doctrine of high wages and, if any of them individually have done so, whether such action has had much effect on business conditions generally. There was no appreciable growth of the purchasing power of wages between 1913 and 1919. The big boost came as a result of the 1920-1923 depression when prices fell more rapidly than wage rates. When employment increased after this depression the buying power of wages gained greatly. Since 1923, said Mr. Soule, there has been a further increase in purhasing power as a consequence of the rapid increase in production, although the gain has been small, the rise in wage earnings having been by no means so great as in the productivity of industry.

It is true, declared Mr. Soule, that the individual employer will gain from a general increase in purchasing power, but it is not true that he will gain much by raising the buying power of his own plant. Outside of men of exceptional resources, like Mr. Ford, individual employers will pay wages that the labor market dictates. Moreover wages can't go up proportionately in all industries. Productivity increases much more rapidly in some lines than in others. Some whole industries are suffering from over capacity and cut-throat competition and in every industry there are marginal plants that can't pay higher wages. The only recourse, in Mr. Soule's view, is to rely on a reduction in the prices of commodities that will stand it to raise general buying power. He does not recommend a 1921 to bring this about, feeling that it will be the natural result of competition. Even among non-competitive industries, such as utilities, the good sense of managements or of governmental regulating bodies should assure reductions of rates or prices.

Cites Change in Attitude Toward Unemployment

COMMENTING on Mr. Soule's belief that, generally, there has been no conscious adoption of the high wage doctrine, Edward Eyre Hunt, secretary of the President's Conference on Unemployment, who was presiding at the session in question, called attention to the marked difference in the attitude of industry toward labor today and immediately after the war. Nothing is more impressive at the present time than the widespread concern over the maintenance of employment.

Real Managerial Ability is Main Requisite for Successful Mergers

THE economic justification for mergers and the limits, if any, on the size of business organizations, were discussed from many angles in different sessions. A paper on the effect of consolidations on distribution expenses, by B. C. Milner, Jr., Ford, Bacon & Davis, New York, is published elsewhere. He emphasized the fact that dependence on mere size is futile—real managerial ability is the most important factor.

The importance of management was also emphasized by C. F. Hammond, Irving Trust Co., New York. Merging is not merely a matter of putting 2 and 2 together and getting 4. One can hitch two automobiles together, but the result will not be twice the speed. The large scale organization, declared Mr. Hammond, is relatively new and scientific management is even newer. To believe that there is a point beyond which a large-scale organization cannot expand without loss of efficiency is similar to accepting the Malthusian theory as final.

Size Depends on Standardization Possible

The size of a business is usually a function of standardization, according to Robert W. Burgess, chief statistician, Western Electric Co., New York, who presented a general analysis of the report on Recent Economic Changes, with emphasis on subjects of practical interest to management. He said in part:

"Standardization is associated with the large unit, individualization with the small. In fact, I should like to suggest that the possibility of an effective large unit depends on the possibility of sufficient standardization of work to be done to permit statistical control. To bring out my point here, consider the possibilities of constructing a country-wide organization for operating in real estate. I do not see how a standard report could be devised by which the central administration could tell whether an operator in a distant town had taken proper advantage of the existing opportunities for the purchase and sale of farms, stores, dwellings and vacant lots."

Despite the importance of statistics to the operation of a large-scale organization, statistics are a minor factor in determining the advisability of a consolidation. Mr. Burgess said, in part:

"The difficulty is that the most pertinent material does not get published in statistical form. I believe more light on this particular question would come from a frank discussion under the auspices of a group such as the Taylor Society, in which various insiders could make generalizations without stating specifically for record that bank A resulting from a merger is carrying quite a load of superfluous vice-presidents but does not have on its staff the first-class specialist in foreign exchange that it really needs, that industrial merger B is proving very successful because price-cutting millionaire X is now inside the fold and can be restrained from doing harm, that merger C of electric light and power plants will have to pass through a long seasoning period because several plants were acquired at a very optimistic valuation and because considerable employee and community ill will was created by the ruthless discharge of superfluous engineers and executives.

Conditions for a Successful Consolidation

"After a series of frank discussions it might be possible to formulate the conditions for a successful merger along some such lines as the following:

a. "The units merged must form a logical economic entity, which will really gain by having a common general staff, common operating methods, a common sales force and/or a common purchasing department.

b. "The financial basis of mergers must not involve fixed interest obligations in excess of developed earning power.

c. "The directors and principal officers of the merger must know their business, with enough grasp of changing economic factors to adjust their policies to current developments.

d. "The merger must secure a high-grade general staff to formulate plans and methods. If the officers and employees of the merged companies do not contain such men, they must be secured elsewhere; some of them, at least, should have familiarity with the business.

e. "The merger must show an obvious improvement in service before it raises its prices.

f. "All former employees of the merged units must be treated equitably.

g. "The merged concern must have good luck as respects such items as fluctuations in the prices of their raw materials and in consumer demand for their product, deaths of the principal officers, earthquake, fire, pestilence and stock market panics."

J. B. Swinney, Special Stores Association, New York, in addressing himself to the subject of mergers, said it was questionable whether they were warranted from the standpoint of any economies achieved in distribution. In retail trade, particularly, individual initiative is highly important. He quoted an old saying that "any business is the length and breadth of the shadow of some individual."

Ralph Borsodi, author of "This Distribution Age," declared that gains from size are confined very largely to production. He said there was something comic about the fact

that constantly decreasing costs of production are being lost in steadily rising costs of distribution.

Functionalization as Related to Size

In discussing whether there is an optimum size of organization, John H. Williams, consulting engineer, New York, said that the answer was mainly one of time. What was true 10 years ago is not true today, and what is true today will not be true 10 years hence. In his opinion, the size of an organization depends to a large degree on the extent that authority can be functionalized. Proper accounting can be made a great aid in visualizing management in terms of the responsibilities into which a business is broken up. Such accounting would make it possible to make incentives effective. Each executive having authority over a certain functionalized activity would have the work under his control measured.

Richard A. Feiss, business consultant, Boston, agreed with Mr. Williams on the importance of functionalization but made the reservation that a good boss with vision is still necessary. Decentralization for action on functionalized responsibilities must be coupled with centralized control. Walter Rautenstrauch, professor of industrial engineering, Columbia University, New York, also pointed out the need for these dual factors in the organization, calling them qualitative and quantitative control. Qualitative control fixes policies and the directions in which an organization is to grow and calls for a catalytic type of mind.

Compromise Between Functionalized and Unified Authority

That complete functionalization is not as practical as a compromise between a functionalized responsibility and unified authority was contended by Malcolm C. Rorty, vice-president, International Telephone & Telegraph Corporation, New York, in a paper entitled "To What Extent Can Large Groups Be Organized and Managed to Realize the Abilities, Capacities and Energetic Efforts of an Individual as Though He Were in a Small Business of His Own?" A liberal abstract will be published in a subsequent issue of THE IRON AGE.

H. A. Hopf, H. A. Hopf & Co., New York, emphasized the personal side of the problem of size, saying that when it is found that decisions are unduly delayed or initiative is stifled, then at that point the optimum size of an organization has been reached.

Consumers' Wants for Particular Goods Limited

A SUBJECT closely tied up with business equilibrium is the growth of consumers' wants. The possibility of producing en masse has been a major factor in paving the way for sharp reductions in unit costs of manufacture, as for example in the automobile industry. If consumers' wants are limited, that fact must be taken into account in estimating the scope of future decreases in operating costs in lines which have been depending for economies on a rising volume of business.

"For many years economists have taught that consumers' wants are without limits," said Paul H. Nystrom, professor of marketing, School of Business, Columbia University, New York, "but this statement has rarely, if ever, been interpreted as meaning that consumers' wants for particular goods are insatiable. Economists have had *general* rather than *particular* consumer demand in view. They have merely called attention to the fact of common knowledge that when certain consumer wants are satisfied others arise. As these are satisfied still others arise and so on indefinitely.

"The suggestion that consumer wants for particular goods are insatiable is contrary to ordinary common sense and every-day observation. Consider your own households. Are the wants of the members of your household insatiable? Are there no definite limits to the amount of food desired? Is there any particularly desirable item for which there exists no point of satiety? Are there no limits to the wants for clothing? For fuel and light? For furnishings and other commodities? If your wants and those of your immediate household are limited for any specific commodity, then is it not reasonable to assume that consumer demand generally, which is but a composite of individual wants, is definitely limited for every particular kind of goods?"

In discussing Mr. Nystrom's paper, Austin Donaldson, general manager, Gimbel Brothers, Inc., New York, emphasized the fact that society is in a dynamic and not a static state. We must expect motion, action, change, variation. From a practical point of view the individual business can rightfully hope to get part of the share of total trade now going to another business. It is true that the stomach can hold only a fixed amount of food, but management is not concerned about that, but rather about the variety of food that can be put into the stomach, replacing a 50c. meal with a $1 meal. What is the high limit of consumer demand today is a low one tomorrow.

Percy S. Straus, vice-president, R. H. Macy & Co., Inc., New York, who was presiding, made the point that it is difficult to ascertain at any one time whether satiety has been reached in a given product. The problem is limited by so many variables that results of investigation are very unsatisfactory. Prices, it has been found, are frequently an important factor. A product that has reached the point of satiety at one price may prove to have a much higher limit at a lower price.

The problem of business balance and regularity of employment raises the question whether the individual

Taylor Society Resolution Offers Suggestions

Whereas, the President of the United States has called a conference of business leaders for the purpose of making plans to promote business stability and prevent unemployment,

Be it resolved, by the members of the Taylor Society, in annual meeting assembled, that the following recommendations be forwarded to the President's conference:

First, since a fundamental factor essential to industrial equilibrium and prosperity is the prevention of wide fluctuations in the general level of commodity prices, we recommend that the conference express its appreciation of the actions already taken by the Federal Reserve System to this end, and that the conference recommend to the Federal Reserve Board that, as a means of reassuring business, they make open avowal of their intention to observe this policy in the future, so far as possible.

Second, since the Government is in possession of much valuable data, contained in the archives of the Treasury Department, the Department of Commerce, and elsewhere, which would be of inestimable value to business, if analyzed and summarized and the results made public, we recommend that the conference propose a plan whereby this information shall be made available to business in such form as not to violate the confidential character of the constituent data.

Third, since many industries are suffering from unbalanced production and other maladjustments, which are harmful to all concerned, including capital and labor, producers and consumers, and since the Department of Commerce, through the Bureau of Standards and the Division of Simplified Practice, has already pointed the way to a form of coordination within each industry which preserves to the public the benefits of competition, we recommend that the conference evolve plans whereby such coordination may be extended into other fields and phases of business and industry.

employer can contribute to its solution. To what extent can he control his business? This question was discussed in detail in a paper by Howard Coonley, president, Walworth Co., Boston. He stated that there are no wholly controllable factors in management, but listed a number that are largely controllable.

Every executive controls materials, although he does not always do it effectively or scientifically. Likewise, labor is assigned to individual departments and to individual jobs. A policy can be set up to govern the great majority of conditions that arise within the field of administration. After all such a policy is merely an economical device for specifying uniform procedures governing repetitive situations. Although volume of sales cannot be included among controllable factors, expenses can be controlled and indirectly influence sales volume and price.

A sales budget cannot be listed as controllable, since intelligent estimating dips into fields where conditions are most variable. But it is surprising, according to Mr. Coonley, with what accuracy intelligent conclusions can be reached in fields that first seem unexplorable. Once the step is taken it is found that possibilities prove probabilities, and probabilities turn into actualities. With a moderately accurate sales estimate, a production program can be established and controlled and the problems of uneven production counteracted with a consequent improvement in efficiency and labor turnover.

Among the uncontrollable items Mr. Coonley listed sales. In estimating sales there is always the difficulty of setting standards for purchases that are made to cover price advances or to insure against a probable shortage. Sporadic demand for slow-moving articles also complicates the machinery of control, since rapid turnover of inventory is not possible.

The labor market is highly seasonal and the productivity of labor is difficult to handle. The financing of business may be planned but cannot be absolutely controlled. Control of marketing is impossible, but offers a fertile field for research. Competitive cooperation may do away with unfair practices, but still holds great dangers that should be carefully guarded against.

Psychology is the most evident of uncontrollable factors. The executive who can gain the confidence and affection of his employees can capitalize this in definite economies.

In discussing Mr. Coonley's paper, F. A. Silcox, New York Employing Printers Association, Inc., said that there are controllable factors even in psychology. Professor Rautenstrauch agreed that there are certain fundamental psychological principles which can be used. One should get firmly in mind, he said, that man cannot make laws, but can conform to laws. There are laws of society and human nature. Our problem is to study the laws of human nature and the laws of conduct. He cited Tammany Hall as an example of control of a great mass of people through psychology.

Employer-Employee Cooperation

HOW employees and employer have cooperated in the interests of scientific management was described in papers presented by J. Foster Smith, agent, Naumkeag Steam Cotton Co., and John P. O'Connell, secretary and business agent, local union No. 33, United Textile Workers of America. Because of conditions in the industry the company was confronted with the necessity of further reducing costs. It presented a proposition to its employees that called for a reapportionment of jobs and the elimination of certain operations, but not the reduction of wages. The employees on their own initiative consulted a management engineer, in the hope that a more satisfactory readjustment could be worked out. As a consequence the company retained this engineer for a thorough study of the plant and the employees are cooperating in efforts to bring about improvements in methods.

In commenting on this experiment Miss Frances Perkins, industrial commissioner, State of New York, said that the important question is whether it is of special or general significance. If it points the way to methods of arousing the interest of the workers in their jobs, it is a great step forward. We live in a machine age and we are challenged to make it an industrial civilization. In the days of the medieval guilds when craftsmen had a wholehearted interest in their vocations and vied with one another in putting skill and art into their work, Europe had an industrial civilization. Greater understanding on the part of workers of their share in the control of our great industrial machine should fire their imagination and add the spice of interest and incentive to work that they too frequently look upon as drudgery.

New Officers

Henry P. Kendall, Kendall Co., Boston, was reelected president of the Taylor Society, and John G. Aldrich, New England Butt Co., Providence, R. I., was elected vice-president to succeed George D. Babcock, Asheville, N. C. Henry Bruere, Bowery Savings Bank, New York, holds over as vice-president. Edward W. Clark, 3d, E. W. Clark & Co., Philadelphia, was reelected treasurer, and Dr. Harlow S. Person was renamed managing director. New directors include Louise C. Odencrantz, executive secretary, Employment Center for the Handicapped, New York, and John M. Carmody, McGraw-Hill Publishing Co., Chicago.

Foreign Trends Discussed at Dinner

ADDRESSES describing the progress of the management movement in Western Europe, England and Japan, were given at the dinner, Dec. 5, by members of the Taylor Society, who had visited these countries in the past year. Henry P. Kendall presided and he and Morris L. Cooke, consulting engineer, Philadelphia, briefly described the recent international congress in Paris.

After seven months in England, during which she visited many of the larger and more progressive plants, Mary B. Gilson, Industrial Relations Counselors, New York, found that the English manufacturer is far from being as unprogressive as is often believed. Much of this impression, she pointed out, has doubtless developed from his unwillingness to talk about himself, or gather with other manufacturers to discuss subjects of common interest.

Victor Karabasz, University of Pennsylvania, gave a few impressions gained from traveling through 17 countries and visiting many manufacturing plants in each. While the scientifically managed European plant is quite as well operated as the better companies in the United States, perhaps largely due to the fact that many of the executives have been trained by working in the United States, he said that there is a much wider gap in Europe between the well-managed plant and the ordinary small company.

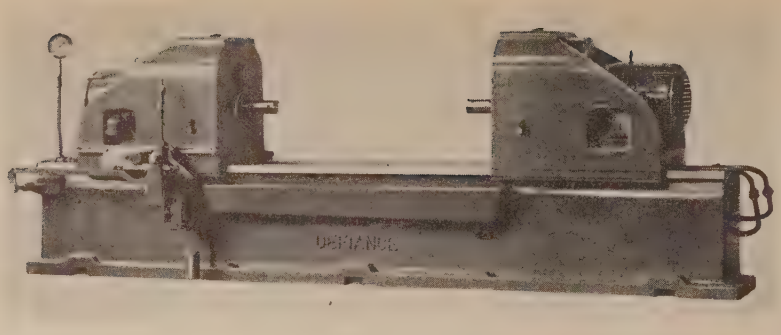
The meetings of the International Industrial Relations Association in Bavaria were briefly summarized by Mary Van Kleeck, Russell Sage Foundation, New York, who pointed out the difficulty of realizing the wide difference in economic conditions faced by various countries of Europe, except at a meeting such as the one held in Bavaria.

A visit to Japan by King Hathaway, consulting engineer, New York, resulted in an unexpected lecture tour by him. The Japanese expressed great interest in scientific management, but appeared to be unnecessarily intent upon expanding their foreign outlets for manufactured goods. He pointed out to many of them the great potential market they had among their own people, which could only be developed through reducing production costs by better methods, although not by the immediate introduction of quantity-production machinery, which would tend to produce too much unemployment.

Barton Rolling Mill Is Sold by Receiver

The Scott-Weiss Steel Co., 110 South Dearborn Street, Chicago, broker in iron and steel products, plants and equipment, has purchased at a receivership sale the plant and equipment of the former Barton Steel Co., 3426 South Kedzie Street, Chicago. Prior to its receivership, the Barton company was a producer of reinforcing bars.

The plant, which is a comparatively new development, consists of four acres of ground, a rolling mill, a one-story structure 98 x 600 ft., warehouse 100 x 400 ft., and a combination office and warehouse.



Two-Way Opposed Boring and Reaming Machine

FOR production work in the manufacture of automobile parts, gas engines, tractors, transmission cases and for other boring and reaming operations or for use as a power unit for driving multiple-spindle drilling heads, a two-way opposed horizontal boring and reaming machine has been brought out by the Defiance Machine Works, Defiance, Ohio. The base of the machine is heavy and rigid, has a cored center and heavy and wide broad ways on which the heads slide. The ways are planed over the entire length of the base providing a center between the heads true and suitable for mounting and clamping a work holding fixture. The base is built in length to suit requirements.

The machine illustrated has single spindle head but heads with any diameter spindle or with as many spindles as desired can be furnished. The spindles are of heat-treated alloy steel and run in anti-friction or bronze bearings. Heads are entirely enclosed and have stub tooth gears and splash or force feed lubrication. The minimum distance between nose of spindles is 29½ in. and the maximum distance with heads open is 57½ in. The height from top of ways to center of spindles is 12 in. The machine is equipped with Oilgear pump for feed or can be supplied with mechanical feed having rapid approach to the work, then desired rate of speed, dwell for facing, automatic kick-off and rapid return movement.

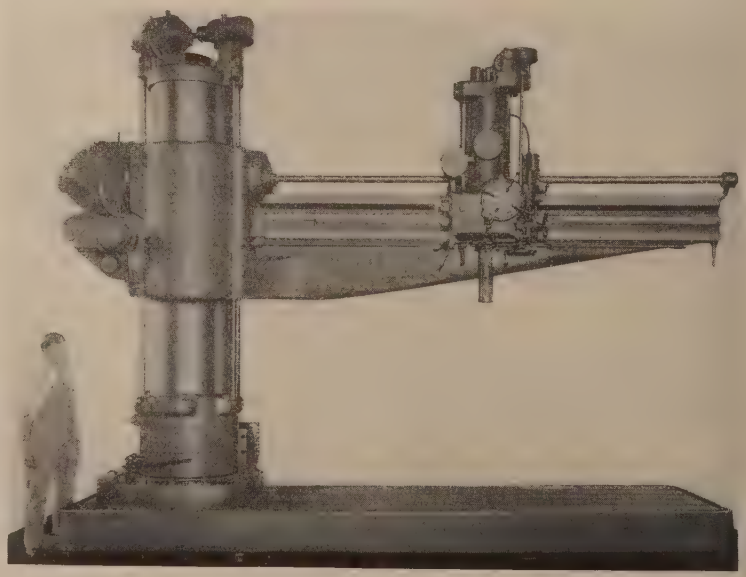
The length of the bed, diameter and height of spindle centers, number of spindles in each head and fixture are determined to suit the requirements of the customer. Motor specifications, giving horse power and speeds, must be determined, being dependent upon the work to be handled. For driving the heads the motors are attached to the drive spindles. The Oilgear pump is driven with a separate motor. The machine occupies a floor space of 13 ft. 10 in. x 55 in. and the net weight is 9710 lb.

Two Mammoth Metal-Working Machines

FOR the Fiat automobile company's Milan, Italy, works the Chambersburg Engineering Co., Chambersburg, Pa., has completed the large steam drop hammer shown at the left.

Although of standard Chambersburg design, the machine is unusual in some of its dimensions. It has a falling weight of 24,000 lb. with a cylinder bore of 32 in. and a stroke of 52 in. The diameter of the steam line is 7 in. and that of the exhaust line 9 in. The distance between the guides is 42 in., and the ram measures 66 in. from front to back. The guides are of the same type as those of the company's latest board drop hammer, the model H, and because of the length of work for which the machine is intended they were made extra wide. The overall height of the hammer, from the bottom of its three-piece anvil to the top of the head, is 34 ft. 10 in.; the height from the floor line is 24 ft. 4½ in. The weight of the anvil, which was made in three pieces to facilitate shipping, is 482,000 lb., while the weight of the upper section of the anvil alone is 222,000 lb. The weight of the complete machine is 662,000 lb.

OF unusual proportions also is the 12-ft. arm 26-in. column radial drill below, which was built recently by the Cincinnati Bickford Tool Co., Oakley, Cincinnati, for a manufacturer of heavy machinery. The machine was equipped with a variable-speed motor mounted on the arm as shown. Features include rapid traverse, power clamping, and electrical control of arm elevating and clamping from the head.



New Large Rotary Grinder

Machine Resembling Boring Mill Is Adapted for External and Internal, as Well as Surface, Grinding

A 108-IN. rotary grinder for grinding outside and inside cylinders and cones, as well as flat surfaces, has been built by the G. A. Gray Co., Cincinnati, for the Chicago Heights, Ill., plant of the American Manganese Steel Co. In general appearance, the machine resembles a large boring mill, the grinding wheels taking the place of the boring mill cutting tools.

The work table is driven by a 5-hp. variable-speed totally-inclosed motor. Two hand levers give four changes of speed, while immediately over these levers is a rheostat which controls the speed of the table drive motor. There is available a wide range of table speeds. The housings are massive and are designed to carry heavy saddles for additional grinding heads, if necessary. They are bolted to the bed of the machine and joined at the top by a rigid brace carrying the gearing and motor which operate the rail elevating and rapid traverse mechanism. The cross-rail, which is similar to a boring mill rail, carries the right and left-hand saddles. On each saddle is mounted a swivel which can, by means of a worm and wheel, be swiveled to any desired angle for the purpose of grinding outside or inside cones. In the swivel are fixed two adjustable bronze bushings in which the spindle rams slide.

Spindle rams are heavy steel forgings which are accurately ground to a uniform diameter. One side of the ram is keywayed to a slight depth to receive the traversing rack, which also acts as a key in the swivel to resist the turning moment produced by the grinding wheel pressure. At the upper end of each ram is secured a flange to which is bolted a 25-hp., 1000-2500-r.p.m. adjustable-speed motor adjusted for dynamic balance. The motor shaft is connected to the wheel spindle by a flexible coupling, and the upper end of the wheel spindle turns in a precision-type ball bearing, while the lower end turns in a pair of precision Timken bearings. The wheel spindle, which is about 6 ft. long, is a heat-treated alloy steel forging with a hardened nose. The spindle and motor armature are so well balanced and rigidly mounted that with the motor running at its highest speed, no vibration or noise can be detected except the rush of the air through the motor armature and around the wheel. To the lower end of the spindle ram is bolted a steel flange to which various types of wheel-guards may be attached. Each spindle is provided with a counterweight, which can be adjusted in amount to suit the weight of the wheel or other attachments, and the inclination of the ram.

Right-Angle Attachment Permits Grinding Flat Surfaces

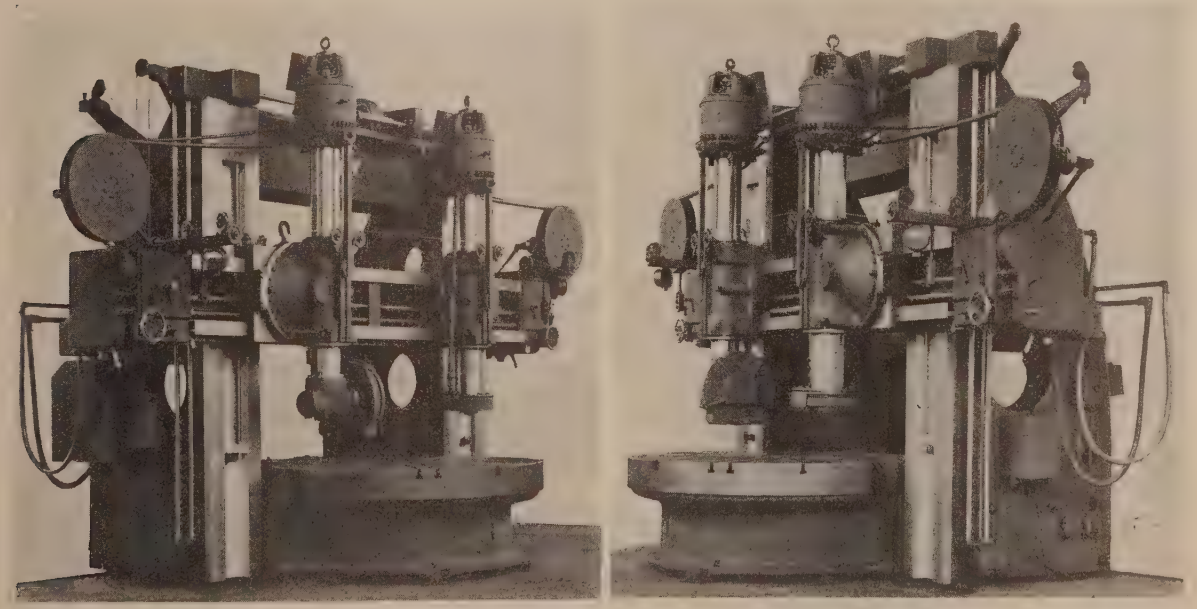
When the grinding wheels are mounted directly on the main spindle they may be used to grind inside and outside cylinders and cones. For grinding cones the heads are swiveled to the desired angle. When the right-angle attachment is used the machine can grind only flat horizontal surfaces. The wheel then revolves in a vertical plane and grinds on the edge.

The saddle is traversed along the rail by means of a heavy rail screw, which may be turned manually by means of a large crank. Immediately over this screw is a feed rod which rotates the rack pinion by means of a worm drive.

On the top brace is a motor which drives the rapid traverse mechanism. From the gear box at the end of the rail project three handles. One of these handles controls the rapid traverse for moving the saddle along the rail. When the handle is depressed the saddle rapidly traverses toward the operator. As soon as the handle is brought back to its mid position the saddle stops. When the handle is raised the saddle traverses away from the operator, and stops traversing as soon as the handle is returned to its mid position. The second handle controls the movement of the ram in a similar way, the ram traversing in the direction that the handle is pushed. The third handle controls the raising and lowering of the rail.

Sixteen Traverse Feeds and 12 Infeeds

Within the large gear case at the end of the rail, and covered by a swinging aluminum door, are change gears operating the traverse feed and infeed. Two levers provided on the front of the gear case are interlocked in such a way that when this traverse feed is connected to the feed rod, so that the ram traverses for the purpose of grinding a cone of cylinder, the infeed mechanism is coupled to the saddle screw. The change gears furnished provide 16 rates of traverse feed, ranging from ¼ in. to 2 in. per revolution of the table, and 12 different infeeds from 0.00025 in. to 0.004 in. per traverse. The feed mechanism is arranged so that whenever the ram reaches its lowest or highest position the infeed becomes operative, the rail screw rotates



Bed, Table, Housings and Rail of This 108-In. Rotary Grinder Are Similar to Those of a Boring Mill. Arrangement of the spindle ram and spindle drive and use of electrical interlocks and other safety devices are among the features

slightly and the wheel is moved into the work the desired amount.

To fix the limits of motion of the ram in the swivel (or of the saddle along the rail) and to reverse the direction of the traverse feed at the end of the traverse, a circular plate is provided which revolves in unison with the movement of the traversing member. On this plate are adjustably mounted two dogs which operate a trip mechanism. The trip mechanism in turn releases an escapement which permits a torque motor to operate the traverse feed reverse mechanism. Each time that a dog strikes the trip mechanism, the direction of travel automatically reverses. If the rapid traverse is used and the ram moved above the upper limit of its travel, it automatically returns as soon as the feed is thrown in.

The pieces to be ground in this machine are large, the material is hard and tough and the wheels wear much more rapidly than they would on a weaker or softer material. In consequence of this, the diameter of the wheel is reduced appreciably during the traverse, so that the depth of cut at the end of the traverse is only a small fraction of the infeed, which is the depth of cut at the beginning of the traverse. To compensate for this wheel wear, a differential mechanism is introduced into the infeed train. This is driven by a small electric motor through a speed changing mechanism. A knob projecting from the front at the bottom of the gear case on the end of the rail adjusts this mechanism so that any desired continuous feed (for the purpose of compensating for wheel wear) can be superimposed on the infeed which occurs at the beginning of each traverse movement.

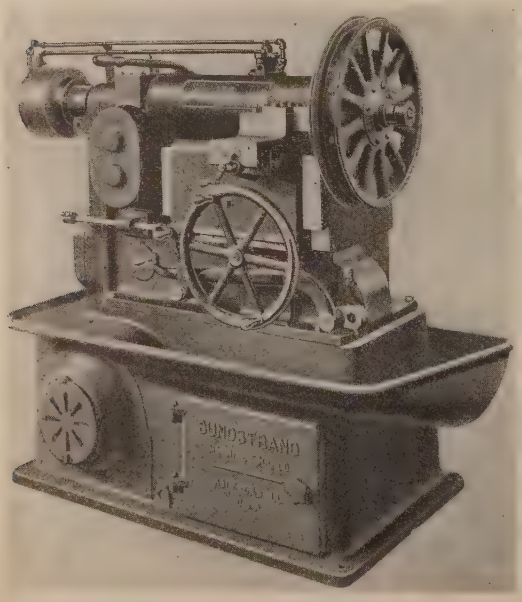
To enable the operator to adjust this compensating feed correctly, each wheel motor is provided with an ammeter which is supported by the counterweight bracket. The compensating feed is so regulated that the power taken by the motor will remain constant during the entire traverse, indicating a constant depth of cut.

Other interesting features of the machine are the electrical interlocks and safety devices which prevent the action of the feeds when the wheel is not rotating and which make it possible to instantly stop all motors by pushing any one of a number of emergency buttons conveniently located.

Lathe for Automobile Brake Drums

BRAKE drum stub lathes designed for turning automobile brake drums after they have been mounted on wheels, and for other work of this general character, are being built by the Sundstrand Machine Tool Co., Rockford, Ill. Twelve spindle speeds, ranging from 40 to 265 r.p.m., and ten feeds, ranging from 0.005 to 0.046 in., are obtainable. The longitudinal travel of the front and rear carriages is 6 in. and the longitudinal adjustment of the rear carriage is 1½ in. Transverse adjustment of front and rear tools ranges from 3⅝ to 6¼ in. Motor sizes recommended are 5 to 7½ hp., 1800 r.p.m. The floor space required is 45½ x 60 in. and the approximate shipping weight is 3500 lb.

R. T. Monahan, 1525 Arcade Building, St. Louis, is now in charge of the sales and servicing of Geometric self-opening die heads, collapsing taps and threading machines in eastern Missouri, southern Illinois, Arkansas and Oklahoma. These products are manufactured by the Geometric Tool Co., New Haven, Conn.



AUTOMOBILE Brake Drums Are Turned on the Lathe at Left, Which Is a Modification of the Sunstrand Stub Lathe

Meter Service Breaker Can Be Set Easily

A CIRCUIT breaker designed to prevent blown fuses and difficulty in locating them has been put on the market by the Square D Co., Detroit. It is arranged for a quicker make-and-break so as to banish contact burning and variable action. The front operating handle is insulated against shock to the operator.

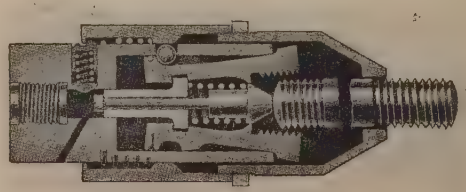
This handle indicates the on, off and tripped positions and can be locked or sealed. It is operated by a toggle and can be reset easily. The box is of the customary size. The circuit-breaking mechanism itself is sealed inside the insulating cover for protection against both tampering and dirt. This unit is made for 30-amp., 125-volt, 2-wire service.

Power-Driven Stud Setter With Quick Release

FOR use on all types of drill presses and on portable pneumatic and electric drills the Titan Tool Co., Erie, Pa., has brought out a self-opening type stud setter that will work efficiently at either high or low speeds and at any angle. Although positively driven, the studs are released automatically when driven to a predetermined height, and the seated studs are free from burred threads.

In operation the tool may be registered or loaded by clamping on to studs previously started in their seat by hand, or by inserting studs in the tool. The positive drive is released when the gage sleeve pushes back the slip ring, which in turn releases hardened steel driving balls. These balls move outwardly into a recess provided in the slip ring. At this stage, the driving jaws remain in complete register with the stud; and to further complete the cycle of operation it is necessary only to lift or pull away the tool from the stud. As the tool frees from the stud, the slip ring acts on the driving balls, forcing them into a driving position. The jaws come out into an open position and the unit is ready to register and drive another stud.

The jaws are arranged to fit closely over the stud, even where the studs may vary as much as 0.015 in. in pitch diameter. Studs as short as ½-in. may be seated with this tool, which is made in two sizes, having maximum capacities of ½ and ⅞-in. respectively.



IN the Stud Setter at Right, the Drive Is Released Automatically When the Stud Is Driven

National Steel Merger Is Completed

New Corporation Became Operative Dec. 4 with Election of Officers—Ingot Capacity 2,000,000 Tons

THE National Steel Corporation, recently formed by a merger of the Weirton Steel Co., Weirton, W. Va., the Great Lakes Steel Corporation, Detroit, and ore mining and blast furnace subsidiaries of the M. A. Hanna Co., Cleveland, became operative on Dec. 4 with a formal meeting of the directors at Pittsburgh. Officers elected at this meeting were: Ernest T. Weir, chairman Weirton Steel Co., chairman of the board; George R. Fink, president Great Lakes Steel Corporation, president; George M. Humphrey, president M. A. Hanna Co., chairman of the executive committee, and F. M. Hesse, treasurer of the Weirton company, secretary and treasurer.

Directors Also Elected

The executive committee consists of the first three officers, who serve also as directors. Other directors are Charles M. Thorp of the law firm of Thorp, Bostwick, Stewart & Reed, Pittsburgh; E. W. Mudge of E. W. Mudge & Co., Pittsburgh; J. C. Williams, president of the Weirton company; F. W. Blair, president of the Union Trust Co., Detroit; Carlton M. Higbie, chairman of Keene, Higbie & Co., Detroit; Howard M. Hanna, chairman of the M. A. Hanna Co.; C. A. Collins, president of the Hanna Furnace Co., Cleveland, and Isaac W. Frank, chairman of the executive committee United Engineering & Foundry Co., Pittsburgh.

Operations of the National company began Dec. 1 with the taking over of control of Weirton and Great Lakes properties and the Hanna subsidiaries. Depositing of Weirton and Hanna stock for exchange with National Steel has been going on for some time. Great Lakes holders will exchange their subscriptions for part paid National Steel receipts, paying out the balance Jan. 31 and Feb. 28, 1930. Temporary stock certificates of the new company are to be ready within a few days, and it is expected that the issue will be listed on the New York Curb market promptly.

Ingot Capacity 2,000,000 Tons

Consummation of this merger effects a completely integrated steel producing unit which, with the completion of previously announced expansion at Weirton and the inauguration of the new Great Lakes company plant at Detroit, will have an annual producing capacity of 3,500,000 tons of iron ore, 1,750,000 tons of pig iron and 2,000,000 tons of steel ingots, with a great diversity of finishing capacity. It will rank as the sixth largest producer of steel in the United States. No changes in executive personnel will be made, active direction of the three companies continuing under present guidance, subject to the executive committee of the National Steel Corporation.

A preliminary balance sheet for the consolidation reveals a financial setup with total assets of $119,982,007.-94 and current assets having a ratio of better than 2½ to 1 of current liabilities. Property account, less $37,288,850 for depreciation and depletion, is listed at $64,867,639. Liabilities include bonds on subsidiary companies listed at $10,370,891. The company has no funded indebtedness of its own, but assumes a mortgage indebtedness covering only the properties of its subsidiaries in Buffalo and certain coal interests. It has no preferred stock or other prior securities, the entire equity being represented by 2,072,000 shares of common stock of no par value, which are listed in the company's balance sheet at $51,-800,000. Surplus amounts to $40,903,-731. Properties appraised by H. A. Brassert & Co., Chicago, at $143,715,-000, in connection with the working out of the consolidation, are carried in the property and investment accounts of the balance sheet at less than $77,000,000. This conservative value results from a combination of the depreciated book values of the companies involved, which have been operated over a long period of years on a conservative basis.

M. A. Hanna Co. to Fund Back Dividends

A plan for the funding of accumulated first preferred stock dividends of the M. A. Hanna Co., Cleveland, is being contemplated. No dividends were paid on this stock from the last quarter of 1925 to the first quarter of 1929, making accumulated unpaid dividends of $24.50 per share. Current dividends were resumed in March, 1929, and have been paid regularly since.

Letters are being mailed to stockholders by the company, outlining the proposed plan, and calling a meeting for Dec. 30 at Cleveland for its consideration. It is understod the plan contemplates authorizing 200,000 shares of no-par $7 cumulative preferred stock, of which about 140,000 shares will be issued at once in exchange for the present first preferred stock on a share for share basis, and to provide funds for payment of the accumulated dividend.

Arrangements have been made by the company to have a sufficient amount of the new stock underwritten at the rate of $90 a share to pay the accumulated dividend. The company is offering to all preferred stockholders who exchange one share of their present stock for one share of the new stock the privilege of receiving in addition either 27/100 of one share of the new $7 cumulative preferred stock, which is at the rate of the underwriting price of $90 a share, or taking $24.50 in cash.

Through participation of some of its subsidiaries in the National Steel Corporation, the position of the Hanna company's preference stock owners is strengthened considerably. The National Steel Corporation will tend to stabilize Hanna earnings through greater diversification. Instead of relying almost entirely upon the conditions of the raw materials markets, Hanna stockholders will benefit from the earnings of the holding company as derived from finished steel income through its interest in the National Steel Corporation.

Funded debt of the Hanna company has been reduced almost 50 per cent by the National Steel Corporation assuming the bonds of the Producers Steamship Co. and the Buffalo Union Furnace Co., two of the Hanna subsidiaries entering the merger. Elimination of these bonds as direct obligations of the Hanna company has reduced almost by half the annual interest charges of $600,000. Wiping out the accumulated dividends on the first preferred eliminates cash obligation of the company to its stockholders of about $2,700,000.

James A. Campbell Not Opposed to Merger

When asked whether his relinquishment of the presidency of the Youngstown Sheet & Tube Co., to become the chairman of the board had any bearing on the possible inclusion of the Sheet and Tube company in a merger of independent steel companies, James A. Campbell said that the fundamental policy of the company he heads will not be changed.

At the same time Mr. Campbell stated that he was not opposed to an independent steel merger, but that, if the Sheet and Tube Company were to be taken in, it must be on a basis that would be fair to its stockholders and employees. He also said that he would continue to direct the shaping of the company's policies.

Mr. Campbell's statement received wide attention because it has been generally understood that he had been opposed to the absorption of the Youngstown Sheet & Tube Co., in a large grouping of independent steel companies.

Since the failure of the negotiations two years ago for a merger of the Inland Steel Co., and the Youngstown Sheet & Tube Co., the latter company has been frequently mentioned, but apparently without official authority, as likely to become a part of the steel merger plans of the Otis & Co.-Eaton-Mather group of Cleveland.

Increased production of the Gardner-Denver Co. will be in effect shortly, when machinery will be installed in a new plant addition at Quincy, Ill. Unfilled orders have been on an upward trend for the past several months.

Flexibility Needed in Materials Handling

Variety of Materials, Unit Sizes, Shapes of Packages, Distance and Route Covered Make Severe Problems

HANDLING any material from any part of a large plant to any other place within the fence is a problem which has not yet been solved satisfactorily, in the opinion of Willard C. Brinton, president, Terminal Engineering Co., New York. He was discussing the progress report on materials handling presented before the American Society of Mechanical Engineers on Dec. 3, at the annual convention in New York. This versatility must be compared with the special cases where uniform packages are taken over a constant route and in regular quantities. It is easy to design equipment if there is only one problem to solve. There is great difficulty, however, when one has a variety of materials, sizes of packages, distances, routes, etc., to deal with.

Emergency repairs constitute a large problem in handling materials. In a large steel mill one Saturday afternoon the speaker found about 300 men busily engaged in taking care of maintenance of machinery and equipment which had been run at top speed through the week. High-priced electricians, mechanics, carpenters and others were doing the manual job of hauling materials or carrying them on their shoulders, and more time was consumed by them in this human haulage than in the practice of their several trades.

In response to a criticism of electric trucks on rough roadways, because of serious battery deterioration, Mr. Brinton said that adequate spring suspension would obviate this difficulty. He has had such equipment working successfully on a rougher surface than one usually expects a motor truck to traverse.

When there are so many starts and stops within an hour as are necessary in handling materials within a plant, including unloading cars and placing goods in stock, etc., gasoline-driven equipment is not so good. Maneuverability, backing ability, etc., are cardinal points required of this equipment. With electric trucks the operator turns on the current and gets his acceleration. There is no need to shift gears or anything else as is required in gasoline-driven equipment.

The versatility of trucks used for this purpose is one of their most important features. This goes along with their shortturning radius and the ability to steer with all four wheels. The latter is particularly important when the load is to be pushed into a definite position.

Transmission Association Holds Third Meeting

The third annual meeting and luncheon of the Power Transmission Association was held at the Hotel Commodore, New York, Wednesday, Dec. 4. Recommendations for reorganization of some of the association's activities were contained in a joint report of the executive committee and the merchandising advisory committee, which is headed by W. W. French, Dodge Mfg. Corporation, Misawaka, Ind.

The report was presented by W. H. Fisher, T. B. Wood's Sons Co., Chambersburg, Pa., president of the association. A special committee with F. H. Willard, president, Graton & Knight Co., Worcester, Mass., chairman, has been appointed to set up a definite program along the lines recommended in the report. Closer coordination of group action and increase in publicity activities are among several recommendations to be considered by the special committee.

William Staniar, belting and transmission engineer, E. I. Du Pont de Nemours & Co., now consulting transmission engineer of the association, summarized the activities of the board of advisory engineers, pointing out that in the two years of its existence, the association had laid a good foundation and has become widely known.

W. S. Hays, Drexel Building, Philadelphia, secretary of the association, in outlining some of the activities of the year, gave in brief the results of a survey of the 1929 business of various divisions of the association. Increased sales in all lines, ranging from 13 per cent in the case of leather belting to 48 per cent in the case of short-center belt drive devices, were shown. The increase in belting sales was taken by some as an indication of a wider use of group driving and in this connection, the increased use of belt drive at the recent Machine Tool Show, as compared to the same Show two years ago, was commented upon. The individual motor was employed but there was a wider use of belts, the flexibility of the belt drive being said to be desired by many designers.

Dr. P. G. Agnew, secretary of the American Standards Association, outlined the organization and work of the A. S. A. and enumerated the standardization projects of direct interest to the Power Transmission Association. Membership in the A. S. A. is now before the board of directors of the P. T. A. In discussing Dr. Agnew's remarks, Secretary Hays said that the standardization of speeds of driven machinery would make possible the simplification of pulley sizes, and thus eventually reduce the inventories of pulley manufacturers.

Directors elected or reelected were as follows: J. E. Henry, secretary, Medart Co., St. Louis; G. H. Fisher, president, Fisher Leather Belting Co., Philadelphia; J. H. Duffy, treasurer, Scandinavia Belting Co., Newark, N. J.; S. P. Browning, president, Ohio Valley Pulley Works, Maysville, Ky.; M. F. Dunne, Pyott Foundry Co., Chicago; C. M. Murray, president, Transmission Ball Bearing Co., Buffalo; D. G. Ong, president, U. S. Leather Co., New York, and H. L. Coates, Flexible Lacing Co., Chicago.

It was voted to include in the minutes of the meeting the association's regret over the death of A. E. Pyott, Pyott Foundry Co., Chicago, Charles E. Carpenter, president, E. F. Houghton & Co., Philadelphia, and Donald A. Hampson, member of the association's board of advisory engineers.

Railroad Club Dinner to Be Attended by 3000

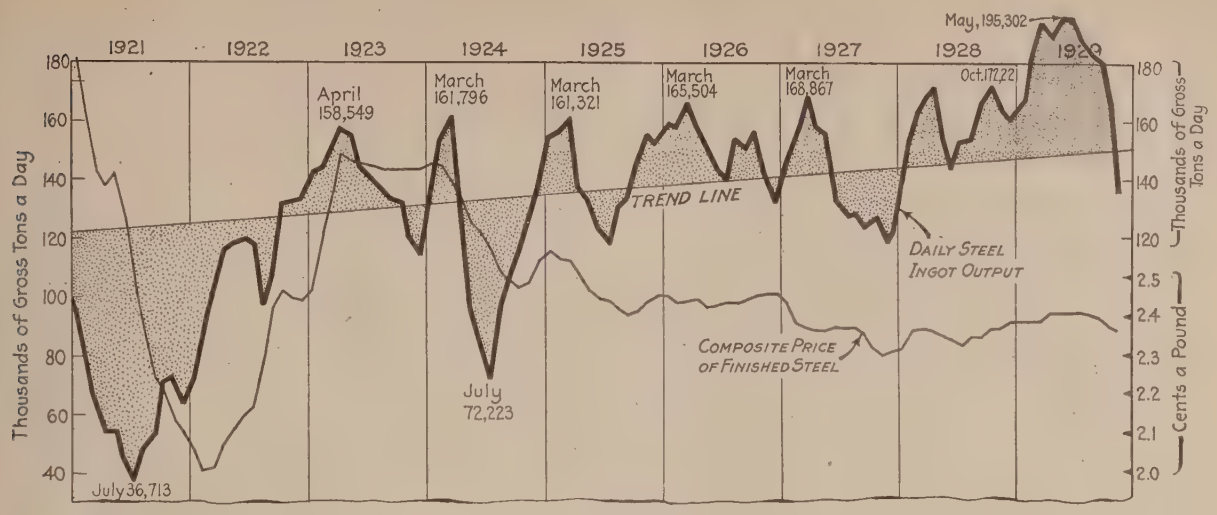
The New York Railroad Club will hold its annual dinner tonight (Thursday) at the Hotel Commodore, New York. More than 3000 reservations have been made. Eliot Sumner, president of the club, will preside. H. H. Vreeland, director of welfare, Interborough Rapid Transit Co., New York, will be toastmaster. After-dinner addresses will be delivered by J. J. Pelley, president, New York, New Haven & Hartford Railroad; George D. Ogden, assistant vice-president, Pennsylvania Railroad, and Congressman Charles Aubrey Eaton of New Jersey. The following railroad executives will be other guests of honor:

Frank Hedley, president, Interborough Rapid Transit Co.; W. S. Menden, president, Brooklyn-Manhattan Transit Corporation; M. H. Cahill, chairman of board, Missouri-Kansas-Texas; R. B. White, president, Central Railroad of New Jersey; C. E. Denney, president, Erie; Graham Sumner, Simpson, Thatcher & Bartlett; W. G. Besler, chairman of board, Central Railroad of New Jersey; J. M. Davis, president, Delaware, Lackawanna & Western; P. E. Crowley, president, New York Central Lines; L. R. Powell, Jr., president, Seaboard Air Line; C. W. Galloway, vice-president, Baltimore & Ohio; G. H. Foster, vice-president, Lehigh Valley; C. H. Ewing, vice-president, Reading Co.; L. S. Miller, president, New York, Westchester & Boston; J. W. Smith, general manager, Boston & Maine; H. J. Humphrey, president, Canadian Railway Club.

To Reroll 4000 Tons of Rails

The McKenna Process Co., Joliet, Ill., has received an order from the Chicago & Alton to reroll approximately 4000 tons of 90-lb. rails. These rails when rerolled will weigh approximately 80 lb. per yard.

Ingot Output in November Made the Sharpest Drop Ever Recorded in One Month. As a result the curve is below normal for the first time in many months. Finished steel prices are about on parity with those a year ago



Sharp Drop in Steel Ingot Output

Eleven Months' Production, However, Exceeds Any Complete Year Heretofore—November Showed Lowest Daily Average Since 1927

PRODUCTION of steel ingots in November was almost 1,000,000 tons below the September and October figures, and was 750,000 tons below the total for November, 1928, according to figures prepared by the American Iron and Steel Institute. No drop of this magnitude has ever before been reported for one month. The calculated November total was 3,513,025 tons, compared with 4,511,650 tons in October.

On the daily basis November, with 26 working days, dropped to 135,116 tons from October's 167,098 tons a day. Not only was the November daily average the lowest of the year; it was the lowest since December, 1927, when 122,134 tons was registered.

Both open-hearth and Bessemer steel were hit by the decline, and about equally. Reports from open-hearth plants showed a drop of 22.7 per cent, from the 3,619,432 tons of October, to 2,797,488 tons in November. Similar returns from Bessemer plants showed a drop of 19 per cent, from the 644,528 tons of October, to 522,672 tons in November.

Year's Record Already Broken

Despite the heavy shrinkage during the month, its output has boosted the total for the accrued portion of the year to a figure far higher than was ever before reached in any complete year. At 51,268,079 tons, a gain was registered of almost 3 per cent above the total for last year, which was by a large margin a high record. Comparing the 11 months of this year with 11 months of last year—itself a record at that time—the gain has been more than 5,400,000 tons, or about 12 per cent. The number of working days in the elapsed portions of the two years has been the same, at 286.

Electric and crucible ingots are not included in these totals. Production of these two types of steel last year averaged about 1480 tons a day. Some such amount would have to be added to the daily figures in the table to obtain the total ingot output of the United States.

In the diagram are traced the course of ingot production and finished steel prices for nine years.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Output of All Companies		No. of Working Days

A patented revolving distributor of the latest roller bearing type has been ordered from A. G. McKee & Co., Cleveland, by the Amtorg Trading Corporation, New York, for shipment to Russia, where it will be installed on a blast furnace. Two electrically-operated scale cars are covered also.

Act to Stabilize Nation's Industries

Industrial Leaders, by Presidential Invitation, Gather in Washington, Tell of Outlooks and Authorize Continuing Committees

WASHINGTON, Dec. 10.—Made up of approximately 400 business leaders, including about 250 trade association executives, the greatest cross section of American industry ever gathered together, the conference held here at the Chamber of Commerce of the United States on Thursday of last week at the request of President Herbert Hoover pledged itself to a program of expenditures for 1930 which it is confidently believed will maintain business activity, wages and employment. It was roughly estimated that the outlay will involve close to $18,000,000,000, thus giving assurance of the determination of business to put to practical application the remedy suggested by President Hoover in his address which opened the conference. His proposed solution, to use his own phrase, lay in "one good word—work."

In order that the program may be pushed forward and government and business may cooperate intelligently, an executive committee will be named to act as a point of contact, supplying information and advice as required.

The conference, which reflected every line of business, as well as finance and agriculture, actually, through the various papers of the groups which were represented, set before the country a complete symposium of conditions prevailing and in prospect. There was throughout an encouraging note sounded. The analyses were based on surveys for the most part, and spokesmen for the various lines of business were careful to avoid an attitude of undue optimism.

Steel Makers Authorize $500,000,000 Expenditures

SPEAKING for the iron and steel industry, as a delegate from the American Iron and Steel Institute, President James A. Farrell of the United States Steel Corporation, pointed out that the steel industry has had a profitable year. Earnings, he said, will enable manufacturers to make improvements long deferred.

"Expenditures already authorized and definitely planned in the industry approximate $500,000,000," said Mr. Farrell. "That is within the industry. Speaking of the industry as a whole, commitments to that extent have been entered into.

"The program of one company calls for $300,000,000 in its 1930-31 budget. The 1930 expenditure has been allotted; that is, the money has been voted and distributed to the different subsidiaries. Precisely this amounts to $160,000,000, and the work is proceeding and will be continued to completion.

"Earnings in the steel industry in recent years were largely expended in plant maintenance. It is well known to those in the industry that our most modern machinery becomes obsolete in 15 or 16 years, so that it requires earnings and surpluses in order to keep up with the times. It is not a question at this juncture of unduly enlarging capacity in our industry, other than keeping in step with the growth of the business.

"The steel plants of the country, having had a good year, will bring plant equipment up to date and contribute their share to general prosperity."

The present rate of operations in the industry, Mr. Farrell said, approximates 65 per cent of capacity. In some lines, such as structural steel, railroad materials, and the heavier lines, it was declared, operations are more extensive than they are in the lighter, or the so-called seasonal lines.

The steel industry was reported as "getting ready for the usual impetus which takes place after the turn of a new year. About this time, we naturally expect a little slowing down." To show the demand in some lines, Mr. Farrell said, one company in November booked as much business as it shipped, a condition described as being most remarkable "in any year, good bad, or indifferent."

Mr. Farrell said he liked the idea of cooperation between government and business and declared that "we have reached a period where, if we are going to be successful, we have got to cooperate, and I think this is going to be the beginning of a great opportunity to expand the business prosperity of our country."

The steel industry, it was stated, rarely has peak years, prefers good average years and expects a good average year in 1930.

"There has been no inflation of prices in the steel industry," continued Mr. Farrell. "There has been no change in our prices for several years. There is no accumulation of large inventories. We will enter the new year with stable prices and stable wages. We cannot have stable wages unless we have stable prices, and we foresee no change in the iron and steel industry in 1930 in either."

Speaking on exports and imports as president of the National Foreign Trade Council, Mr. Farrell said that during the first ten months of the current year exports showed a gain of 6.5 per cent and imports a gain of about 9 per cent over those for the corresponding period of last year. The prospect was declared to be for a substantial excess of exports over imports for the year. Mr. Farrell said that there is no basis for reports of friction between the United States and foreign countries over what might seem to be an intensive effort to increase foreign trade.

"We have got to have an exchange of trade," said Mr. Farrell. "We thrive on exchange of trade."

Julius Barnes, presiding as chairman of the conference, read a telegram from Chairman James A. Campbell of the Youngstown Sheet & Tube Co., who, after saying illness prevented his attendance at the conference, announced that the board of directors of the company on Tuesday had appropriated an additional $2,000,000 to its previous budget of $15,000,000 for its 1930 construction and maintenance program.

Machinery Builders Report on Orders

SPEAKING for the machinery industry, Otto H. Falk, president, Allis-Chalmers Mfg. Co., Milwaukee, said that there are about 10,000 large and small institutions comprising the machinery manufacturing group and that they are just concluding the biggest year in their history. He said that he had received the request to make a survey of conditions so late that the investigation was only cursory, but that there appears to have been no recession of business resultant from the adverse psychological condition created by "recent Wall Street events." He said he had found no one in the industry who anticipated much, if any, change during 1930.

Reports from the Wisconsin Manufacturers' Association coming from 64 machinery concerns were read to the conference. In answering the query as to the present situation regarding advance orders and business prospects as compared with that a year ago, 27 reported no change; 26 reported an

increase and 11 reported a decrease. In reply to the question as to prospects for business during the next six months when compared with the past six months, 26 reported no change; 26 reported improvement and 12 reported a decrease, four of the latter being seasonal. All 64 concerns reported that no wage reduction is contemplated.

Another statement read by General Falk concerned business conditions reported by mail from a group of machinery dealers in Connecticut, New York, Ohio, Pennsylvania, and Wisconsin. Their reports, it was stated, are almost the same as those received monthly throughout the year.

They reported as follows:

Inquiries—80 per cent report fair to good, with a recent tendency to slacken.

Domestic orders—75 per cent report fair to excellent.

Foreign orders — Unsatisfactory, only one or two reporting otherwise.

Labor situation — Generally satisfactory: Common, plentiful; but considerable scarcity of skilled.

Production—Plants running 75 per cent to 100 per cent.

Competition was declared to be keen but business was generally good.

"If you will allow me to make a suggestion which may be helpful, I would recommend," said General Falk, "that this conference go on record in asking that this Congress pass a tariff bill without further unnecessary delay, to relieve the uncertainty in business on this subject. It is my candid opinion that this would be more helpful than any other one thing in stabilizing business."

The machinery industry, said General Falk, sees blue skies ahead and will cooperate in every respect in any program that may be outlined by the conference.

Electrical Industry Looks for 3½ Per Cent Let Down in First Half

REPORTS from the electrical industry, according to the president of the National Electrical Manufacturers' Association, Clarence L. Collins, president, Reliance Electric & Engineering Co., had been received from 178 executives and in his judgment the first six months of 1930 will show a decrease in their productive activity of about 3.5 per cent as compared with the corresponding period of 1929.

It was stated that in spite of the slightly increased volume of business at this time, the aggregate figures on inventories show that the situation today is almost identical with that existing last year at the same time. Making approximate estimates for some of the companies that did not report, Mr. Collins said the questionnaire represented an aggregate in man-hours of about 500,000,000 or possibly an annual productive wage of $300,000,000.

A significant fact was that the branch of the industry that represents electrical appliances going into the home, said Mr. Collins, has the expectation of an increase in 1930 over the corresponding period of 1929. The judgment of the executives of companies manufacturing products going into the building industry showed a decrease. A slight recession, it was said, was expected in products going into industrial plants.

It was predicted that the 1930 program of that part of the industry representing the larger electrical appliances, generating appliances, and power distributing appliances, such as go within a large industrial program for public utilities, will be fully equal to 1929. In the electrical products that tie in with the electrification of railroads, a slight recession of business is expected, it was stated. Major contracts, however, it was added, will be reflected in the business of 1931. In capital expenditures, the belief was expressed that those of the electrical industry will be nearly normal.

Capital Expenditures of Railroads Put at $1,050,000,000

PROPOSED capital expenditures of the railroads amount to $1,050,000,000 for equipment and roadway and structures, and it is estimated that the first quarter of 1930 will absorb $212,000,000 and the second quarter, $278,000,000, or a total of $490,000,000 for the first six months as compared with $350,000,000 total expenditures for the first six months of 1929.

R. H. Aishton, chairman, executive committee of the Association of Railway Executives, said:

"The situation as of Oct. 1 showed a greater authorized program of railway improvements and capital expenditures under way at that time than in any similar period for the past five years. Briefly, it called for an expenditure within the next few months of $674,000,000 or $272,000,000 more than on the corresponding date in 1928.

The railroads do not believe there is anything in existing conditions that warrant them to reduce or abandon any part of their capital program. Instead, however, they are proceeding with confidence in the future business prosperity of the country and in reliance upon the full cooperation of industry in all its branches, equally interested.

"In addition to the capital expenditures outlined above, the railways are expending this year $1,300,000,000 or more in the purchase of supplies for operation and maintenance, ranging all the way from soap to steel castings, and $3,000,000,000 in wages to railway employees.

"Both these forms of distribution of money, aggregating nearly four and one-half billions of dollars, the railways expect to equal in 1930 and will represent a direct flow of cash into the channels of trade and industry. This distribution is additional to the $1,050,000,000 that the railways are now planning as their capital program next year."

Mr. Aishton also said that he was authorized to announce for the Pullman Co. that its capital expenditures for equipment in 1930 will be $11,900,000, of which $3,000,000 each will be spent during the first and second quarters.

Tribute Paid to Trade Press by Dr. Julius Klein, Assistant Secretary of Commerce, in address before Business Conference.

"A further factor contributing toward the success of any such undertaking as that which is now engaging the attention of business leaders everywhere is the vastly improved quality and increased influence of the trade press. It was but a short while ago that the resources of a very few large corporations permitted of any considerable collection of reliable trade and industrial data. Today the keen acumen of our trade editors and their expert staffs has made the sequestration of any important economic facts very difficult, if not impossible."

Automobiles and Ships

THE country at large need not worry about the motor vehicle industry, the conference was told by Alvan Macauley, president, National Automobile Chamber of Commerce, and president of the Packard Motor Car Co. He said the industry doubtless would share to some extent any difficulties that may beset the country, "but we will never be down seriously or for long."

Homer L. Ferguson, president, Newport News Shipbuilding & Dry Dock Co., reported improvement in the shipbuilding industry but said that the shipyards of the country can handle 50 per cent more work than they are handling in 1929. He spoke of prospects, through awards of ships in connection with mail contracts to be good, but added that what is needed is a continued steady flow of new orders. This, it was declared, can be obtained only by the development of paying and prosperous steamship lines.

"It appears," he said, "that freight ships cannot be built in the United States and for the foreign trade with-

out further aid from the Government. The demand for more ships for the foreign trade is up to the Government and it is hoped that the action taken by it will be reasonable in character, so as to enable shipowners to operate them continuously and successfully."

The Continuing Committees

The two committees of business men who are to follow up the work of the National Business Survey Conference have not been appointed at this writing. One of these probably will have a personnel of 15 or 20. It will be a working organization of outstanding leaders, whose purpose will be "to obtain and collate more detailed reports and to devise measures to eradicate whatever weaknesses in the national economic structure they might reveal," according to announcement of the Chamber of Commerce of the United States.

The other committee will be larger and advisory in character, based on trade association representation.

It is assumed that a general committee named at the conference last week, which was made up of 70 business leaders, will assist in selection of these two committees, though this point was not made clear. Among members of the committee selected at the conference were James A. Farrell, New York, representing the American Iron and Steel Institute, and General Otto H. Falk, Milwaukee, president Allis-Chalmers Mfg. Co., representing the machinery industry.

It was made clear at the White House that the Chamber committees will be temporary, rather than permanent. The President, in his address opening the conference, pointed out that the business interests had been invited "to create a temporary organization for the purpose of systematically spreading into industry as a whole the measures which have been taken by some of our leading industries to counteract the effect of the recent panic in the stock market."

In order to perform its part in the program the Department of Commerce has set up a new division to coordinate the construction programs of the Federal, State and local governments.

Chairman Julius Barnes, discussing features of the conference, said that the large capital expenditures for the purposes outlined must be provided from industrial treasuries or most largely by borrowings for capital investment. He pointed out how the Treasury refunded $325,000,000 at 3⅛ per cent against its last borrowings at 4⅞ per cent, not long ago, "probably the most extraordinary change ever recorded in Treasury operations between transactions.

C. M. Schwab Sees Healthy Outlook

Business Almost Entirely Unrelated to What Happened in Wall Street, He Says, and Never in More Stable Position

"AMERICAN business has assumed today a role of greater importance in the social and economic life of the country than it has ever filled before." This statement was made by Charles M. Schwab, chairman of the board of the Bethlehem Steel Corporation, at the thirty-second annual dinner of the Illinois Manufacturers' Association, Dec. 10, at the Stevens Hotel, Chicago.

"For the first time in history, all the forces of business, banking, industry and transportation," continued Mr. Schwab, "have been marshalled under the leadership of the President himself in the most constructive peace-time effort any nation has ever seen. This is business and governmental statesmanship of the highest order. One does not have to be a confirmed optimist to see in Mr. Hoover's conferences something more than a determined and powerful endeavor to substitute a new psychology for the one that has been almost inevitable under similar conditions in the past.

Country's Business Structure More Stable Than Ever Before

"My own view is that two of the outstanding factors in the present situation are these: This is the first time that business in its essential aspects can be regarded as almost entirely unrelated to what has happened in Wall Street, and the whole business structure of the country has in recent years become more stable than ever before.

"Several months ago, I suggested to the steel industry at the annual meeting of the American Iron and Steel Institute that the most fundamental progress made this year was in the degree of stability and balance which had become outstanding characteristics of our business. Other industries have made similar progress. The effect, therefore, of the conference between Mr. Hoover and the spokesmen for American business must inevitably be to preserve the stability and balance throughout the whole business structure. I think the results will be even greater and that we can also look forward to a wholesome expansion of business without the evils of artificial stimulation.

Industry Better Equipped and More Intelligently Managed

"Let me give you a few reasons for my own faith in our continued progress:

"Industry generally—the machinery of prduction—is better equipped and more intelligently managed than at any time in the past. Owing to long-continued good railroad service and the ability of manufacturers to get their needs promptly filled and their products promptly distributed, there are no disturbing stocks of goods or raw materials, and management in the meanwhile has become increasingly better able to adjust production to current demand.

"For the most part, too, this year has produced remarkable earnings, and the cash resources of most business enterprises are exceptionally strong. Credit has become plentiful, also.

"Agriculture, under the stimulus of the Federal Farm Board, has become enabled to organize itself on a more business-like basis and is making great progress already in this direction.

High Standards of Living Are Bulwark of Our Prosperity

"Moreover—and this is the most important aspect—there is today a greater and more widespread recognition on the part of all concerned—stockholders, manager, and Government—that our high standards of living constitute the bulwark of our prosperity and that the purchasing power of the people who buy our goods and services must be maintained.

"These are just a few of the indications of the real soundness of American industry. Taking the steel industry as an example, this year has been one of splendid progress. Production will probably exceed by about 10 per cent what it was in 1928. No big inventories have been built up, earnings have improved in all branches and prices for the most part have been stable for the reason that they have contained no element of inflation.

Healthy Outlook for Steel's Three Biggest Customers

"Steel's three biggest customers, the automobile, railroad and building industries, seem to me to justify a healthy outlook. We are a growing country and in addition to normal growth, which the Wall Street affair cannot seriously retard, the replacement factor alone in these industries furnishes a very substantial market for them and for ourselves. Just as the replacement factor in the automobile industry increases in importance as more automobiles go into service, so it is with buildings and so it has always been with railroads.

"It is upon the continued prosperous condition of our people generally that the future of our industry depends. But the determination of the Government and of the business leaders of the country to keep the wheels of industry turning, to provide continued employment, to protect purchasing power and to look forward may be regarded as a guarantee of sound and steady progress."

This Issue in Brief

How can you determine the most economical production quantity? Balance up between direct labor cost in production, and preparation or setting-up cost before production begins, is the criterion, says engineer.—Page 1585.

* * *

Not enough production foremen to supply needs of industry, says engineering society. Nearly 600,000 such positions exist. Yearly replacements number 30,000, but technical institutes are turning out only 10,000 graduates a year. —Page 1580.

* * *

Few mergers are really successful, says engineer. Theoretical savings are rarely realized, due largely to the fact that the effect on the most important factor, the human element, cannot be predetermined. — Page 1575.

* * *

Welding efficiency averages 75 per cent in all-weather work on oil line. Tests of arc-welded joints reveal that efficiency ranges from about 61 per cent to 94 per cent.—Page 1578.

* * *

Criticizes uses of case-hardened or nitrided materials for essential locomotive parts like main pins or axles. A crack in the hard, brittle surface is propagated through the ductile core. Hard wearing surface can be produced on a thin bushing, which can be replaced if cracks develop.—Page 1592.

* * *

Tungsten-carbide cutting tools may permit use of harder and stronger steels for parts subject to heavy stress in automobiles and other machines. Ability of the cutting alloy to machine hard surfaces opens possibility of using lighter sections. — Page 1594.

What is alloy steel? There is no clear understanding of just what an alloy steel is. Current statistics do not correctly measure entire production. — Page 1594.

* * *

Aircraft sales for 1929 will probably equal only one-half the estimate of 14,000. Production facilities for motors greatly exceed demand, but demand will catch up if production expansion slows down to a sane rate.—Page 1596.

* * *

Economic disturbances were formerly regarded as self-corrective. Will the Washington attempt to stimulate business produce a hesitant and prolonged adjustment?—Page 1597.

* * *

Are higher wages paid because of necessity or through belief in their economic advisability? With few exceptions, employers pay the wages the labor market dictates, says economist. Not so, says another, contrasting present situation with that of 1921.—Page 1599.

* * *

The business is too big if decisions are unduly delayed or if initiative is stifled. The ideal size of an organization depends in large degree on the extent to which authority can be functionalized.—Page 1600.

* * *

Cuts weight of part in half by substituting pressed steel for aluminum casting. Portable electric drill manufacturer also reduces labor and material cost one-third.—Page 1582.

* * *

Improves vitreous enamel surface by burning electrically. Close control of temperature betters quality of work. Smoke and gases are absent.—Page 1581.

Makes gray iron in rotary melting furnace. Flame enters at one end and leaves at the other. Contamination of iron by gas and oxide is slight. One pound of coal melts 7.4 lb. of iron.—Page 1586.

* * *

If you plan a merger, don't ignore the personnel. Experience shows that the confusion and suspicion resulting from throwing two or more organizations together often results in increased, rather than decreased, costs.—Page 1577.

* * *

Unwise extension of production facilities should receive attention of President Hoover's body of business leaders. Economist recommends that the body advise on use of capital.—Page 1598.

* * *

Steel output drops to lowest point since 1927. November daily production was 135,116 tons, almost 20 per cent below the October rate. But 11 months' total is a record, and surpasses any previous full year.—Page 1607.

* * *

Bakes aluminum casting cores in automatic conveyor oven. Conveyor chain is 660 ft. long, about 250 ft. of it being in the oven. —Page 1591.

* * *

Foundry equipment manufacturers contribute equipment for municipal foundry school. Grammar school graduates admitted to four-year training course in Cleveland school. After first year they work half time in foundries. —Page 1579.

* * *

Reduces raw material inventory 21 per cent by making longer and less frequent production runs on staple products. Raw material purchasers are scheduled to arrive just in time to meet production schedules.—Page 1584.

The Concern of Business

"WE are concerned with employment. We are concerned with good wages. We are concerned with prices. And lastly, we are concerned with the continuance of good business, which will enable industry to earn sufficient to maintain all."

—James A. Farrell, president, United States Steel Corporation, at the business conference held at Washington, Dec. 5

Our National Income

ANY apprehension that still exists because of the catastrophe in the stock market doubtless reflects incomprehension rather than reason. Fear of the unexplained is a characteristic of human nature. What has happened is still not understood. If we had better economic data we should better understand the situation.

During the prolonged upward movement in the stock market it was repeatedly pointed out by conservative economists that what was occurring was a writing up of the paper representing a part of our national wealth rather than reckoning an increase in that wealth itself. Similarly and in consequence there might be a writing up of our national income without there being any real increase in it.

These conditions produced much perplexity. Some authorities who estimate the national income figured it as rising at a rate of phenomenal rapidity and attaining a figure of upward of 90 billion dollars per annum, and although such an estimate appeared incredible it was adopted by bankers, financiers and promoters because it suited them. Other authorities, however, could not arrive at figures showing anything but a slow, normal increase and totals never much exceeding 75 billion dollars.

The only explanation of this discrepancy was that one set of economists was reckoning what might be called earned income, reflecting the production of goods and services, while the other set was reckoning earned income plus capital gains, so to speak, following the thought in the requirements for our income tax returns. Plainly it would ensue from this that capital gains might in some year be replaced by capital losses, with strange exhibitions in the reckoning of our national income. If such a conception were valid—as it is not—there would be grave cause for apprehension now.

If there had been any real appreciation in wealth, realized in capital gains and so appearing in national income, that should have been followed by increase in earned income, inasmuch as it would have had to be expended for goods and services. Our national production statistics did not, however, in the aggregate reflect any such thing, and contemporaneously it was perplexing that they did not. The only logical explanation was that realized income from capital gains was being used not for more goods and services but rather for the purchase of other stock certificates, less the cut of the tax-gatherer and some relatively minor diversions, and that some day we might descend the hill just as we had ascended it.

We are mindful that we are attempting herein to draw a very broad picture and that there are many details that would look conflicting if they were examined. Thus we have certainly produced greatly increased quantities of some goods; automobiles, for example, and the steel and copper with which to make them and the petroleum with which to operate them. On the other hand we have produced less of other things. Such conditions show dislocations that may be in the way of progress, or at least in the way of change in our mode of living and consequently will be enduring; but which may have been carried too far and therefore require correction.

The adjustment of economic dislocations is apt to be vexatious, just as is the reknitting of a broken leg; but a broken leg has none of the seriousness of a broken spine. The fundamental things in our national economy are our earnings and our thrift. We are certain that nothing has happened to impair our earning capacity. We may reasonably expect that our earned income in 1930 will be as large as in 1929 unless there be some adversity of nature that no one can foretell. We shall not, however, have any more illusion that our income is more than it really is or ever was.

Direct and Removed Demand

IN present conditions it is especially necessary in making appraisals of the state of trade, as indicated by demand for various commodities, to make allowance for circumstances in the individual commodity, whether it is one in direct demand or in removed demand. A commodity in direct demand, according to the terms we are here using, is one that is being sold directly to the ultimate consumer. The demand is one degree removed if the commodity is sold to a dealer who sells to the ultimate consumer or if it is raw material for a manufacturer who sells to the ultimate consumer, and so on. A commodity may be many stages removed.

In the long run it is necessarily the ultimate consumer who determines the total volume of demand. Except in the possible psychological case of a "buyers' strike," of which we heard so much in 1920, some of it

perhaps not altogether to the point, the ultimate consumer buys according to his resources. This ultimate buying has a momentum, so to speak, producing relative steadiness.

Not so with the removed demand, which is subject to two influences. First, the appraisal of the future made by the buyer, whereby in anticipation the retailer may buy less goods or the manufacturer less material. Second, during the course of a slowing down, either of these buyers will purchase particularly less because with a smaller turnover he needs less goods in stock or material in process of manufacture.

This is a matter that may be overlooked on account of the point so much mentioned that in these recent years stocks have not been carried. The reference is really to reserve or extra stocks. There must be some goods in the retail store or in the warehouse and some material progressing through the manufacturing establishment, and the amount will vary according to the volume or rate of turnover.

A familiar and apt illustration is found in outside or purchased scrap for the open-hearth steel plant. In this case there is an exaggeration, for as the plant slows down it has a supply of works scrap disproportionate to its new rate of working, and the outside scrap must take the total fluctuation. By the same token the requirements in purchased scrap become particularly large when the plant is speeding up.

When a change occurs in the general trade outlook, the immediate effect is least upon direct demand and greatest upon demand that is removed the largest number of stages from the direct. Demand upon the clothing store will be one thing, demand for pig iron to make textile machinery another, decreasing more or increasing more according as the general outlook is down or up. In the last few months the steel demand of the automobile industry has furnished a concrete illustration, slowing down more rapidly than did the actual production of automobiles. The scrap demand of mills specializing in automobile steel slowed down still more.

To determine the state of trade and prospects from the indexes, all indexes should be consulted, but each should be considered according to the proximity or remoteness of the commodity relative to ultimate consumption. When this has been done there is a disclosure of the position of the buyer, which is made up of two elements, his actual condition, physical and financial, and his mental attitude as to the future. Statistics of retail sales represent two factors, the financial condition of the people and their views as to the future, whether they think they see better or poorer times ahead for them.

With a commodity of ultimate consumption subject to seasonal variation in demand, the more removed materials, the successive raw materials, will fluctuate much more in demand than the commodity itself, there being curtailments all along the line at one time and expansion all along the line at the other. By this principle a commodity in particularly poor demand at one time will be in particularly good demand at another.

A MEASURE of the reduction in employment prior to the Wall Street crash is afforded by figures of the United States Bureau of Labor Statistics. In 2265 identical plants in ten branches of the metal-working industries, employing 1,214,708 people in September, the drop to 1,160,559 on payroll in October was 4.46 per cent. The decline in payroll total was not quite so sharp, having been 3.67 per cent on a September weekly wage of $38,373,000. Pay envelopes averaged $31.59 a week in September, going up slightly to $31.86 in October. Of the loss of 54,149 from payroll lists, no less than 45,331 were in the automobile branch.

A Question of Ethics

THE Soviet Union is engaged upon a five-year plan for economic construction. An interesting and elaborate book describing this program has recently been issued by a well-known New York publishing house under the auspices of the Amtorg Trading Corporation, which is the commercial and industrial representative in America of the Soviet Union. The development plan is ambitious, calling for the expenditure of 33 billion dollars for the creation of plants during the next five years. The proper equipment of a great country like Russia would undoubtedly lead to such an investment, or more. Doubt may be entertained as to whether the Soviet Union can finance it; and whether it could be physically consummated in five years, even if it can be financed.

This program is necessarily framed with reliance upon American assistance, in rendering which American engineers, manufacturers and exporters are obliged to take their own chances, inasmuch as the Soviet Government of Russia has not been recognized by the American Government and there is no probability that it will be until the Soviet Government has acceded to our straightforward conditions of (1) the return of property confiscated from our citizens, (2) recognition of indebtedness owed to our Government and our citizens, and (3) abstention from communistic propaganda in our country.

With agreement to those simple terms of human morality we should have nothing but good wishes for the Russian Government and the people whom it represents. If the Russian people choose to continue to conduct themselves in accordance with a social theory that we condemn, that is their own affair. Such a difference of opinion would not prevent us from extending such assistance as might be requested.

Consequently, when it is now a matter of developing economic facilities, such as railroads, the generation and transmission of electricity, etc., or the development of natural resources that are unquestionably the property of the Russian nation, we may be generous in our attitude, always with reservations in respect to risks that must be assumed. We may even be careless as to questions of title among the Russians themselves. When, however, there are properties involved that were confiscated from foreigners, questions of ethics may well be considered.

Leslie Urquhart, chairman of the Russo-Asiatic Consolidated, Ltd., draws attention to this in a recent communication to the *Engineering and Mining Journal*. The Soviet Government took the mines belonging to that company, the metallurgical works that it had erected, and also its working capital, in respect to which the company has a claim against the Soviet

Government for £66,000,000 in case it decides not to return the property. In 1922 the Soviet Government signed an agreement to return the property, together with compensation of over £2,000,000, but has refused to carry it out. American engineers who are invited to assist in the development of such properties should pause to reflect as to professional ethics.

Russo-Asiatic was probably the severest sufferer in this way, but we may remind ourselves that many American companies were likewise treated. The Singer Mfg. Co. wrote off a loss on its investment in Russia in terms that approach that of Russo-Asiatic and would have ruined any enterprise that did not possess its colossal strength, while the International Harvester Co. and many others were similarly robbed.

We think that if the Russians want copper, lead and zinc, sewing machines, agricultural equipment, etc., they would do best to return these properties to their rightful owners and let them furnish the goods that are desired, being sure that they would then be furnished more economically than the Russian or any other Government could do. This, however, is a question of economics as to which there may be different opinions. The other thing is a question of morality, as to which there can be only one opinion.

Paradoxes in Acts and Thoughts

THE existing situation among us is producing some paradoxical occurrences but much more in paradoxical thought. Of the latter we have made notes of a few. We derive them mainly from remarks in the financial journals. But we interlard them with comments that are more serious.

One expressed opinion was that in the efforts to promote business the Sherman law will be permitted to become quiescent. It would follow from this that the Sherman law is a discourager of business. Well, perhaps that is so.

Anyhow, the Sherman law is supposed to be promotive of competition. In the retailing of cigarettes competition has all but ruined a great chain store system, and as for the little retailer his sales have become more or less accidental and he sees his means of livelihood vanishing, wherefore his organization is appealing to somebody to do something. This looks like the Sherman law working upside down.

The copper producers are adjusting themselves to a contracting demand by curtailing their production, wherefore alert bears sold copper stocks and a journalistic writer expressed the opinion that a diminished production was as bad as a reduction in price. However, the copper producers did not see it that way.

The Prince of Wales urged the women of his country to lengthen their skirts and otherwise increase their clothing in order to assist the British manufacturers of textiles. American manufacturers would like the women of this country so to conduct themselves. The style makers of Paris appear to be conniving in this. Our women, however, are vociferating that they will never forsake the freedom of short skirts, and Paris be hanged.

Mr. Ford made a dramatic gesture in raising the wages of his employees. The textile manufacturer has not the means to do such a thing. Mr. Ford resolves the labor question into a quasi-baronial system of profit-sharing. Of course that does not work when there are not any profits and raising wages is not therefore a general panacea for counteracting industrial depression.

Our last remark leads us to the thought of what would be the situation if the encouraging recovery in the stock market should continue; and if stocks should regain the high level of last summer. Should we then look back upon October and November as merely a nightmare?

IF individual demand is caused to shrink, under the influence of a drastic decline in stock market prices, or of a conception of thrift as saving money by withdrawing it from active business, or of a spread of indolent habits, then industrial activity must decline. Higher wages could help consumption were productive efficiency increased in proportion. Cutting the percentage of profit to raise wages could only have the effect of checking the improvement of plant, equipment, designs, tools and fixtures, which is indispensable to the increase of output per worker, and therefore to the increase of the general purchasing power. Western philosophies may follow those of the Orient in theorizing that less work and more leisure is the ideal; but the people of industrialized countries find their greatest comfort and happiness in discovering and supplying new wants.

CORRESPONDENCE

Early Coal Breaker of Steel Construction

To the Editor: For the sake of historical accuracy, I refer to the statement on page 1519 of your Dec. 5 issue, to the effect that there were no steel coal breakers in the Pennsylvania anthracite region 25 yr. ago, and refer you to the Transactions of the American Institute of Mining Engineers, Vol. XIX, which contains a paper by the late Eckley B. Coxe, describing the iron breaker at Drifton. This paper was read at the New York meeting of the institute in September, 1890. This breaker was completed about that time, and has been in operation ever since. No wood enters into its construction except the window sash. There are many cast iron columns in the structure, but considerably more roll shapes and fabricated girders.

This breaker stood alone as an example of iron and steel construction for many years before the coal companies gathered sufficient courage to adopt the steel construction method. In fact, Mr. Coxe's own company built a breaker entirely of wood, some ten or twelve years after the Drifton breaker was built. I believe, however, that it was more a question of the difference in the cost of material in that day.

J. H. PENNINGTON,
Manager, McFarland Foundry & Machine Co.
Trenton, N. J.

Bearing Investigations Put Under Way

At a meeting of the Heavy-Duty Anti-Friction Bearing Committee of the American Society of Mechanical Engineers, in the Engineering Societies Building, New York, Dec. 6, it developed that two of the leading bearing manufacturers have large-scale experiments already under way in efforts to determine bearing pressures on roll necks and elsewhere. These investigations are independent of that which is being sponsored directly by the committee.

Sufficient support to carry on the committee's work for about a year has already been pledged by steel companies, bearing manufacturers and others. A fellow is to be appointed whose work will be done under the general direction of Prof. W. Trinks, Carnegie Institute of Technology, Pittsburgh. He will collate all available data and discover places where experimental work would be most useful. He will carry on experimental work, insofar as may be possible, both in the Carnegie laboratories and in operating steel mills.

It is hoped, by the coordination of these several efforts, to make it possible to design roller bearings for this particular work which will take up less space than now seems to be required, and which at the same time can still be depended upon to function adequately under operating conditions. It is realized that the investigation is likely to cover a considerable expanse of time, but those backing it appear to be satisfied to carry it on to completion.

Scrap Institute Proposes Inspection Service

At a meeting of the Boston chapter of the Institute of Scrap Iron & Steel, Inc., Thursday evening, Dec. 5, at the Parker House, Boston, it was voted to recommend that a national inspection bureau be established by the institute to inspect material shipped to steel mills. It was recommended that inspection be by a neutral body; that local customs of each mill be taken into consideration during inspection, and that the cost of inspection be charged to the shipper requesting such inspection.

Will Not Expand Taylor Tin Plate Plant

The Corrigan, McKinney Steel Co., Cleveland, announces that it does not contemplate making extensions to the tin plate plant at Cumberland, Md., of the N. & G. Taylor Co., Philadelphia, which it recently purchased. The plant will continue to be operated under its present name and the new owners will follow the policy of the old organization in limiting its output to high-quality products in tin plate and terne plate.

The Week in Business

Drift of Current Financial and Economic Opinion

SOME tightening of credit, not necessarily portentous, is indicated by a large increase in loans on securities by member banks of the Federal Reserve System (8369 millions of dollars at the end of November against 6724 millions a year ago). A decided expansion in commercial loans is also shown. The total of bank loans on securities outside of New York, Benjamin Baker points out in the *Annalist,* continues practically undiminished, and he concludes that, with the increase in total loans, a large carry-over from the stock market crash is still to be disposed of; that an increase in loans can hardly be accounted for on the score of business activity. "This situation," he says, "is one of the indeterminate elements in the business outlook." He suggests that the when and extent of the recovery will depend on how courageous and thorough the liquidation is.

The Bureau of Business Conditions of the Alexander Hamilton Institute believes likewise that the increases in commercial loans represent to some extent borrowing on other assets to protect security holdings. The Federal Reserve Bank of New York finds that the liquidation has been almost wholly in loans by lenders other than banks.

Would Control the Business Cycle

Much that is being written regarding the Hoover conferences is highly repetitious. The plans of the more or less temporary committee or economic council to project the influence of these conferences and secure concrete results in maintaining employment has naturally brought out a few observations that the council may be intended to arrest or modify the business cycle. If it shall prove possible to "prevent the occasional depression which has hitherto been felt with regular irregularity," says Theodore H. Price, in *Commerce and Finance,* "then science will have achieved a great victory over human nature."

Words of caution still appear that the expansion programs encouraged by these Washington conventions must not be extended to increase activity among industries that actually require adjustment downward, lest the results aggravate the very conditions in need of correction. Leo Wolman, of the research staff of the National Bureau of Economic Research, makes the point that these meetings are of indispensable service, in the field of public work, by securing the whole-hearted cooperation of thousands of public officials and the breakdown of traditional executive procedure through the pressure of organized public opinion.

High Wages and Prosperity

Out of the welter of analyses and surveys of the causes of the Wall Street crash is coming a questioning of popularly accepted explanations of the prosperity which preceded it. The *Financial Chronicle* emphasizes that in holding that high wages are the key to prosperity, we are living in the midst of a huge delusion. Its argument in part is that the present static scale of high wages was begotten of the war, that agriculture and common labor have had to meet peace time conditions, that "the receipt of high wages by the few, increasing their consuming or buying power (though at the expense of increased price to the many) enabling them, let us say, to pay more for goods bought for sustenance and use cannot be the chief cause of 'prosperity'," because this fraction of labor cannot consume the total production of all other labor. Meanwhile that journal holds the Reserve Banks as responsible for the whole speculative debauch.

As to the end of the period of the recession, rather vague guesses are made as yet in circles outside of business and commerce. A passing reference is made by the National Industrial Conference Board that the American situation is not free from world-wide conditions, but if it is money that is needed, to increase international trade, late indications are that foreign loans are again becoming popular in the United States.

Iron and Steel Markets

Sentiment in Steel Trade Improves

Resumption of Automotive Demand, Large Tin Plate Releases and Sustained Railroad Needs Are Heartening Influences

SENTIMENT in the iron and steel industry has improved. December will be a poor month both in shipments and production, but this fact is not causing concern, since most consumers are reducing their stocks to a minimum preparatory to taking inventory and the price situation holds no incentive for forward buying.

What has impressed the trade is the reassuring manner in which business has reacted to the stock market crash. Apprehension regarding possibilities has given way to manifest satisfaction with what has actually occurred in recent weeks. Railroad orders, shipbuilding contracts, steel fabricating work and specifications from farm equipment makers have been in consistently good volume, apparently unaffected by Wall Street deflation.

Among some of the miscellaneous consumers also there have been evidences of a good rate of activity. Wire rope makers are feeling the stimulus of larger demands from public utilities. Hardware manufacturers and steel barrel makers have increased their specifications. Chicago reports crane and shovel builders busy, with books well filled for four months. Nowhere are there signs of a general paralysis of trade such as developed after other stock market panics.

Not the least among encouraging factors is a betterment in demand for automobile steel. Motor car builders have placed a fair amount of bar, sheet and strip business in new orders, specifications against contracts or releases of suspended shipments, and two of the larger manufacturers have put out inquiries for their first quarter requirements in steel bars. Although it will probably be some time after the first of the year before the motor car industry gets back to fair operations, production of new models in the low-priced class is slowly increasing. With returning confidence, the automobile trade is surveying prospects for 1930, and, while estimates of the year's output are still conservative, they range from 4,000,000 to 4,500,000 vehicles.

The scrap trade at Chicago and Pittsburgh shares the better feeling manifest among steel producers. A mill purchase of 10,000 tons of heavy melting scrap at the former center was followed by advances of 25c. to 50c. a ton in prices paid on dealers' trades. Prices at Pittsburgh also are pointing toward greater strength.

Steel ingot production has undergone little change since a week ago. The output of Steel Corporation and Bethlehem plants remains at 68 per cent of capacity. District operations have increased in Alabama to 85 per cent, but appear to have receded at Buffalo and Youngstown, where production is irregular, probably not averaging much more than 40 per cent. The Chicago and Pittsburgh district rates are unchanged at 65 per cent. With the approach of Christmas, output is expected to contract further, since year-end mill suspensions are likely to be longer than usual.

Railroad equipment business includes a purchase of 1285 freight cars by the Missouri Pacific, supplementing that road's order for 1000 cars a week ago. The Van Sweringen lines are expected to enter the market in a week or two for 13,000 cars.

Rail bookings have been augmented by 23,000 tons placed by the Atlantic Coast Line with the Bethlehem Steel Co. and 5100 tons by the Elgin, Joliet & Eastern with the Illinois Steel Co.

Structural steel lettings were in good volume for the season, totaling 35,000 tons. New inquiries, at 31,000 tons, include 19,000 tons for New York subway work. The contract for 55,000 tons for the Empire State Building, New York, is due to be awarded within a few days. Evidence of progress on public utility programs is seen in inquiries for a number of structural projects, among them a 3000-ton addition to a Chicago district power station. Fabricated steel awards in metropolitan New York in November totaled 44,000 tons, compared with 27,500 tons in the same month last year.

Demand for ship steel continues to expand. W. R. Grace & Co. will build one to four vessels, taking 6000 tons of steel each. About 5000 tons of plates will be required for nine oil barges awarded to the Bethlehem Shipbuilding Corporation. The Tidewater Oil Co. has placed two 13,000-ton tank ships with the Sun Shipbuilding Company and the Standard Shipping Co. will award contracts for four tankers.

Mills making a diversified line of products have been faring better than those more largely dependent on the automobile industry. Bookings of railroad steel, structural steel, tin plate and ship steel help to explain the Steel Corporation's gain in unfilled tonnage in November. Shipments averaged 40,000 tons a day and bookings 41,000 to 42,000 tons, and the net gain for the month was 38,783 tons.

The railroads, in addition to placing equipment and rails, are in the market for plates, shapes and bars. The Norfolk & Western and the Chesapeake & Ohio are each inquiring for 2500 tons.

Tin plate specifications are improving and the mills of the leading producer are now running at 80 per cent of capacity. This rate contrasts sharply with 50 per cent operations in the sheet industry and 20 to 40 per cent output by strip mills.

Pig iron demand continues to lag, but more interest is being shown in first quarter requirements both by the automotive industry and other consuming lines.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

Pig Iron, Per Gross Ton:	Dec. 10, 1929	Dec. 3, 1929	Nov. 12, 1929	Dec. 11, 1928
No. 2 fdy., Philadelphia	$21.26	$21.26	$21.26	$21.26

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Industry Looks to Moderate Improvement Early in New Year—Pig Iron Output Further Curtailed

PITTSBURGH, Dec. 10.—Improved sentiment, which began to make itself felt about the first of the month, is still the dominant feature of this market, although it is now only too evident that December is going to be a very poor month from the standpoint of both shipments and production. Consequently, steel makers have turned their attention to the prospects for the beginning months of the new year and invariably find them encouraging. The explanation offered by some that conditions can hardly grow worse is far from satisfactory, as they have been far worse even in the memory of the less experienced, and the expectation of improved steel demand in January and February must be based on much more tangible evidence.

It is possible that too much importance is attached to the report that the leading maker of low-priced automobiles is planning a schedule of 180,000 cars in January. The common supposition is that other automobile makers, particularly those in the same price class, must also increase operations accordingly. This does not necessarily follow, but it does seem reasonable that the larger automobile companies may be expected to receive considerably heavier steel shipments in January than in November or December.

Other large consuming industries are seemingly more definitely committed as to their needs. Users of steel, both small and large, are reducing their inventories as much as possible this month, and will certainly stock up again after the first of the year. Present specifications are nearly all for urgent shipment and this offers proof of the closely regulated flow of raw materials into plants. Another point emphasized, especially by makers of heavy steel products, is the fact that steel for most of the heavy railroad buying in the present quarter will not be rolled until early next year, and will provide heavy backlogs for certain producers.

Steel ingot operations in the immediate Pittsburgh district do not average above 65 per cent of capacity this week and this is considerably higher than the average in the Valleys or the Wheeling district. The well-sustained schedules of the two largest steel producers in the Pittsburgh area are still responsible for the better showing here.

Among the finishing mills, the departments making rails, structural shapes and plates are running at a slightly better rate than the open-hearth average, but the sheet industry is not above 50 per cent and bar mills are no better off. Strip mills continue to curtail production, and complete suspension of activity Christmas week is already planned by some strip producers. Other companies will take advantage of holiday week to close some departments and will operate mills at as high a rate as is justified this week and next in order to raise Christmas pay envelopes.

Prices on finished steel products are still holding in a general way, at least among the smaller buyers, who usually pay the full market quotations. Few of the larger consumers have covered for their first quarter requirements.

Pig Iron.—This market is beginning to show signs of life. While there has been no appreciable increase

in sales over last week's, sellers in this district have taken the usual number of small lots for spot delivery, and one merchant furnace took an order for 500 tons of foundry iron. Inquiry for first quarter is also beginning to come out. The Westinghouse Electric & Mfg. Co. is asking for prices on the usual quarterly tonnages required at its Trafford City, Pa., and Cleveland plants, and a few other buyers who have not yet made formal inquiry are preparing to do so. Sellers who have been canvassing the trade rather thoroughly in the last week or two report considerable activity in prospect for malleable as well as jobbing foundries, and the steel foundries will undoubtedly require a considerable tonnage during the first quarter. Consumers' stocks are low, and efforts are being made to reduce them to the minimum for inventory taking. For that reason, shipments continue to decline slightly. The Davison Coke & Iron Co. has banked its Cherry Valley furnace, which leaves only three strictly merchant furnaces operating in Pittsburgh and the Valleys, and reduces merchant iron output to the lowest point of the year. All sellers have reaffirmed the present prices of $18.50 for foundry and basic iron, and $19 for malleable and Bessemer for first quarter, and a few sales have been made at those figures. The local furnace will continue to quote prices 50c. over these levels.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—So far as can be ascertained, none of the users of semi-finished steel in this district has placed a first quarter contract. In many cases considerable tonnage on present contracts is yet to be shipped, and as companies are not anxious to receive this material before the end of the year, many of them will enter the new year with some tonnage owed them on old contracts. This is particularly true in the case of strip and sheet makers, who have been operating at a very low rate in the last two months. Under the circumstances, present quotations of $35, Pittsburgh or Youngstown, on billets, slabs and sheet bars are still untested. A Cleveland mill is said to be soliciting first quarter sheet bar business at $34, but this competition is not yet a factor in the Pittsburgh district. Nevertheless, sharp declines in sheet prices have made the sheet bar prices comparatively high, and some downward revision would not be considered unusual at this time. Forging billets are holding at $40, Pittsburgh, and wire rods at the same figure. A few users of rods have closed for the first quarter. Sellers of skelp are renewing contracts on the old basis of 1.85c., Pittsburgh.

Bars, Shapes and Plates.—The market continues rather dull, and interest is centered in first quarter prospects rather than in the immediate outlook. It seems certain that the remainder of the month will see no marked improvement in demand for bars, while contemplated projects requiring heavy tonnages of shapes and plates are likely to be postponed until after the first of the year. A local building for McCann & Co., requiring 900 tons of shapes, was placed last week, while 450 tons for transmission towers in Louisiana was taken by a local fabricator. Otherwise structural awards have been few. However, shape mills are well supplied with tonnage for some time to come and are running at a better rate than many other departments. Car builders tributary to Pittsburgh mills are still adding to their backlogs, and one is now booked at a fair rate over the first half of next year. Steel tonnage releases for this business are not reaching local mills at a very brisk rate. Barge yards are cleaning up old orders and a few units are being built for stock. About 1400 tons of plates will be required for water tanks in Wisconsin and Long Island, which have been placed with a local fabricator. The bar business is still exceedingly dull, but some of the dependable consuming industries have not reduced their requirements very much this quarter. However, cold-finishing mills are taking only small tonnages, and, with the reinforcing bar trade seasonably quiet, aggregate demand would not be impressive even if the automobile industry were operating at a normal rate. Occasional price shading is reported from time to time, but no transactions have come to light which might indicate a market quotable at less than 1.90c., Pittsburgh, on bars, plates and shapes.

Bolts, Nuts and Rivets.—This industry has not felt the lessened steel buying as much as some other departments, and most of the reduction in demand in the last few weeks can be traced to seasonal considerations such as year-end inventories. Shipments to the automobile industry have naturally declined, but the railroads are increasingly larger buyers, and the average operating rate for the industry is not less than 50 per cent of capacity. Present quotations of 70 per cent off list on bolts and nuts, 70 and 10 on small rivets and $3.10 a lb. for large rivets, have been reaffirmed for first quarter business and contracts are now being closed for that period.

Rails and Track Accessories.—Specifications for track supplies are light, but it is much too early to begin shipping tonnage for spring work. Rail mill operations are gradually improving, but will not reach their peak before January or February. Light rails are moderately active. Prices on track accessories are holding fairly well in a quiet market.

Wire Products.—Business is quiet, but spot orders for small quantities of wire and nails from jobbers are accounting for normally good tonnage for this time of the year. Comparatively, demand for manufacturers' wire is hardly so good, as this product is dependent enough upon the automobile industry to be seriously affected by low production in that field. The trade is now being canvassed rather actively for first quarter contracts, and a number of users have closed for that period at $2.40 to $2.50 on wire nails, and 2.55c. to 2.65c. on annealed wire. Wire mills are running at 40 to 50 per cent of capacity.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C. $10.70 | 25-lb. coating I.C. $15.90
15-lb. coating I.C. 13.40 | 30-lb. coating I.C. 16.80
20-lb. coating I.C. 14.60 | 40-lb. coating I.C. 18.80

Alloy Steel Bars

(F.o.b. makers' mill)
Alloy Quality Bar Base, 2.65c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	46
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Tubular Goods.—Although the season is practically at an end for both standard butt-weld pipe and heavy lap-weld material, mills are still shipping some tonnage in these lines, and December has started out to be about as good as it usually is. Large projects, which were talked about earlier in the year, will be delayed until early spring, and mills expect little further activity in line pipe for some time. Oil country demand is quiet, and as distributers' stocks in the oil fields are ample, shipments may be rather light in the next few weeks. Efforts to curtail oil production are still being watched with considerable interest by pipe makers, and some of them are hopeful that a definite program is not far in the offing. Mechanical tubing is quiet, although a few automobile makers are beginning to plan their requirements for January.

Sheets.—Specifications last week showed improvement, according to some makers, and the leading interest has scheduled its mills for a slightly better rate of operation. The last two weeks in the month may be somewhat lower, but makers are now somewhat more hopeful, and with shipments to the automobile industry at a low point, they are assured that even a slight improvement from that consuming industry would be immediately reflected in higher operating rates. Building materials made of sheet steel are normally quiet at this time of the year, but agricultural implement makers are still taking heavy tonnages, and the car builders are entering substantial orders for material for box car roofing and doors. The radio industry is taking very little sheet steel at this time, but the tonnage of electrical sheets is holding up well. Prices are still subject to some uncertainty, but the market has a firmer tone than it had two weeks ago. Black sheets seem to be fairly well established at 2.75c., Pittsburgh, and, although some buyers insist that they have had lower quotations mills are inclined to hesitate in recognizing such competition. Blue annealed sheets and light plates are now quotable at 2.35c. and 2.20c., Pittsburgh, respectively, and with mills selling the jobbing mill product generally refusing to meet the competition of wide strip these prices are well established. On galvanized material, the 3.40c. to 3.50c. Pittsburgh, range applies to practically all the tonnage now being placed. Metal furniture sheets are now quotable at 4c., Pittsburgh, as against the recent range of 4c. to 4.10c., which places them on the same basis as automobile body sheets.

Tin Plate.—Operations this week may show some improvement, although specifications are not much heavier than they have been in the last two or three weeks. At some mills the higher operating rates are made possible by tonnage which has been allowed to accumulate, while other companies plan to suspend operations during Christmas week, and are already arranging their tonnage schedules to accommodate this. The leading interest plans to operate at above 80 per cent again this week, although the rate of independent makers is not above 65 per cent of capacity.

Strip Steel.—Although conditions in the strip industry show no general improvement, a few companies have received some fair orders from the automotive industry for January delivery and see in these the promise of improved business next month. Mill operations are still very low and intermittent. With many units closed down entirely one week and running four or five days the next, it is difficult to gage the industry's operating rate, but a fair estimate would be about 40 per cent for hot mills and 20 to 25 per cent for cold. Prices lack strength, but considered in the light of business being placed, are holding remarkably well. Efforts to take business from the regular customers of one mill by another are uncommon, and a good percentage of first quarter contracts have been signed at the regularly quoted prices. Some buyers are inclined to seek concessions, but the market is still quotable at 2.75c., Pittsburgh or Cleveland, on cold-rolled material and 1.90c. and 2c. on hot-rolled.

Cold-Finished Steel Bars.—The market is very quiet, but prices apparently are firm and operations are well accommodated to light current demand. A few automobile companies are beginning to show interest in their first quarter requirements, particularly January tonnage, and reports thus far are encouraging. The agricultural implement industry is taking a substantial tonnage. Mills are quoting 2.20c., Pittsburgh, on cold-finished bars and 2.55c. to 3.50c., mill, on ground shafting, according to size.

Coal and Coke.—Coke business is dull. Lack of sustained cold weather is discouraging to the market for heating coke. The furnace grade is weak at $2.65, Connellsville, but lower quotations are not frequently met and no large inquiries have come out which might lead to sharp concessions. Foundry coke shipments are still declining, and spot purchases are infrequent. Although $3.75, Connellsville, is still the quotable minimum on 72-hr. coke, prices as low as $3.50 are not uncommon. The market for domestic coal is slightly more active, but industrial consumption is curtailed.

Old Material.—The scrap market has a considerably better tone this week, and dealers are generally of the opinion that prices will go no lower at present. This opinion also seems to be shared by a few mills in adjacent districts, which have made some effort in the last week to buy scrap at the present low levels. In the immediate Pittsburgh district the only sale reported was that of the Pennsylvania Railroad scrap, on which the No. 1 heavy melting steel brought up to $15.60 at a local mill. However, a considerable amount of this material was sold at prices ranging from $15 to $15.50, and the market on No. 1 heavy melting steel this week is much more clearly defined at $15 to $15.50 than it was last week. Other grades of scrap also are unchanged, but in nearly all cases the present quotations are somewhat stronger than they were a week ago. Demand for specialties continues to be heavy, and the steel wheels on the Pennsylvania list are reported to have brought $20.25. Dealers are watching the trend of the finished steel market closely in an effort to ascertain the probable course of operations during January, and they now believe that considerable improvement will manifest itself in the first two months of the new year.

Milled studs	70

Chicago

With No Further Recession in Ingot Output, Low Point Is Believed to Have Been Reached

CHICAGO, Dec. 10.—For the first time in several weeks, ingot output in this district has held at a uniform rate, and this situation is giving rise to the thought that the low point in steel production, as gaged by consumption, has been reached. However, it must be kept in mind that consumers are unusually cautious and will take tonnage only in limited amounts for immediate use. As long as this situation lasts, a change one way or the other by users will be quickly reflected at mills, especially with rolling schedules often as close as five or six days.

Ingot output is at 65 per cent of capacity, which closely matches with this week's specifications, part of which are coming to local mills from a wider territory. Sales of finished steel continue to drag, this being especially noticeable in commitments for future delivery. Railroad purchases this week are light, but the undertone of this market is strong. One estimate made here promises that close to 14,000 cars will be purchased in the Western market in nearby months, while miscellaneous rail tonnage still to be covered is said to be not far from 100,000 tons. The buying movement in track accessories to accompany 1930 rails is not yet under way, and production of these commodities is moderate in volume.

Several indications give rise to the thought that sentiment among manufacturers of automobiles is improving. Inquiries for pig iron from this source are more numerous and releases for immediate shipment show improvement. A parts maker is asking for prices on first half needs and several others are actively in the alloy steel bar market.

Crane and shovel builders are busy, some having books well filled for four months. Both specifications and forward contracting show farm implement manufacturers to be maintaining a high rate of output, with well arranged schedules for the next few months. The arrival last week of a cargo of steel and the expected docking of a boatload of pig iron before the close of the week mark the closing of the navigation season for Lake movement of blast furnace and steel mill commodities.

Ferroalloys. — Forward contracting for ferromanganese is well under way at $100 a ton, delivered Chicago. Commitments are being freely entered for 50 per cent ferrosilicon at $83.50 a ton, delivered Chicago.

Pig Iron.—The feature of the local pig iron market is an improvement in sentiment, which is evidenced by new buying and specifications for iron from manufacturers of automobiles and parts. The volume of this business is not large, but it implies that a turn for the better is at hand. Demands from other sources are measurably larger, with the result that December shipments are averaging better than the November rate. This week marks the closing of navigation, as the last boatload on order docks at Milwaukee. Four charcoal iron furnaces are in blast and stocks are in moderate volume. Prices of this grade are steady at $24, furnace, for tonnages from current make. The necessity to move some grades from stocks occasionally brings out lower quotations. A local steel mill has a tonnage of basic to sell, but recent demand has been limited to carload lots.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Rails and Track Supplies.—Estimates made here indicate that about 100,000 tons of standard-section rails will be purchased from local mills in the next 45 days. Much of this tonnage will be made up of miscellaneous orders from the smaller railroads. A Northwestern railroad, which normally buys 25,000 tons of rails, has still to come into the market for 1930 requirements. It is significant, according to the views of local sellers, that the total tonnage already purchased this year is measurably ahead of the requirements made known up to this time a year ago, and it is more or less taken for granted in the local market that the total tonnage, when completed, for 1930 deliveries will show a substantial increase over the 1929 shipments. Purchases this week totaled several thousand tons in small scattered lots. The track accessory market is quiet both in sales and inquiries. The 14,000 tons needed by the New York Central is still before the trade.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.30c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—The feature of this market is the fact that public utilities are taking preliminary steps in the matter of winter buying. Although no definite inquiries are before the trade, the announcements made recently that public utility expenditures for improvements will be heavier in 1930 than in the current year lead sellers to look forward to a more active market. Chicago has taken bids on 800 tons of 6 to 12-in. pipe, and Franklin County, Ohio, will receive tenders Dec. 15 at Columbus on 15,000 ft. of 6 and 8-in. pipe. A few scattered orders for carloads have been taken for small municipalities near Chicago. Deliveries on common sizes are prompt. Prices remain steady at $43.70 to $45.70 a ton, delivered Chicago.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Sheets.—Releases of sheets have not been in sufficient volume to support output at the rate of a week ago and, as a result, production at hot mills has been revised downward to 45 per cent of capacity. Some units are running three days a week, and schedules on the whole are seldom made for more than six days in advance. Forward buying is in smaller volume than a week ago. Usually expressions of future needs come from manufacturers who have taken business and therefore have prices for their goods established. This is the situation with several barrel manufacturers and makers of roofing materials. As in recent months, the blue annealed commodity is the most active of hot mill products. Chicago delivered prices are steady at 2.90c. for black sheets, 3.55c. to 3.65c. for galvanized sheets and 2.35c. for No. 10 blue annealed.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Structural Material.—The most active field in structural steel at the moment is in power plant additions to public utility properties. Figures have been taken on a 3000-ton addition to the Public Service Co.'s plant at Waukegan, Ill., and 400 tons will be used for a similar project at Lin-

coln, Neb. Public utility engineering offices and consulting engineers who do this kind of work are busy, and several of them report that work is now being planned for more than two years. Railroad bridge purchases in recent months have been heavier than is customary in the fall, and on this score the trade feels that little more will be purchased for delivery in the early spring. Reports indicate, however, that contemplated railroad bridge work for next year will make use of a round tonnage of steel. Several large bridges are being planned by Western railroads. The only local award of note is 1800 tons for the Fine Arts Building, Chicago, on which the steel will be fabricated at a moderate rate as required for the revamping of this old structure. All shops in this district, with the exception of one or two which are beginning to fabricate large tonnages for affiliated companies, are operating at greatly reduced schedules and are eagerly seeking new work. Competition has lowered prices named by fabricators.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Bolts, Nuts and Rivets.—Contracting for the first quarter is progressing satisfactorily at unchanged prices. Specifications from the implement trade are large and steady.

Wire and Wire Products.—Little change has occurred in this market in the last week. Distribution by jobbers is in smaller volume as the winter season advances, but reports from most districts point to a substantial volume of business in the spring. Specifications from the manufacturing trade are small in the aggregate. Forward contracting is unusually slow and producers report the volume of business now on books the lowest in several years. Wire mills are engaged at 50 per cent of capacity.

Bars.—Use of mild steel bars by the general run of manufacturers is in moderate volume. Forward buying is not active and spot purchases are individually small and for prompt use. A fair part of current rollings is being taken by car builders and manufacturers of farm machinery, neither of which have cut output schedules in recent weeks. Prices for mild steel bars are steady at 2c., Chicago. Output of alloy steel bars is little above 50 per cent of capacity of local mills. Current specifications are a trifle heavier than the tonnage needed to support mill operations at the present rate. Automobile parts makers are signifying their intention of making larger use of this commodity. Demand for iron bars is steady, the bulk of the tonnage moving to car shops and railroads. Use of rail steel bars by barn equipment makers is expanding slowly. The bed industry continues to operate at a rate which is close to normal for this time of the year. Rail steel bar mills are operating at 60 per cent of capacity and deliveries are prompt. Shipments so far this year are practically equal to the tonnage moved in the corresponding period of 1928.

Old Material.—Some support has been given to the Chicago scrap market by purchases of 15,000 to 20,000 tons of heavy melting steel for delivery at Gary. The price reported to have been paid is $13 a gross ton, delivered. Dealers have rushed in to cover this and other orders, with the result that prices being paid on dealers' trades have risen 25c. to 50c. in the week. In some quarters the thought is expressed that the market has definitely turned upward and some brokers are inclined to go long of the market. However, consumers' interest in buying still drags, and it is definitely known that many buyers, including some large consumers, have sizable stocks on hand. The cast-iron borings market is at a standstill, with little tonnage coming on track and users' interest at low ebb. Recent sales by railroads have brought out prices of $13.50 a gross ton, delivered, for heavy melting steel.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.00 to 13.50
Hydraul. compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
No. 1 busheling	11.00 to 11.50
Forg'd cast and r'l'd steel carwheels	17.50 to 18.00
Railroad tires, charg. box size	17.50 to 18.00
Railroad leaf springs cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	17.75 to 18.25
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	14.50 to 15.00
Low phos. plates, 12 in. and under	14.50 to 15.00
Blast Furnace Grades:	
Axle turnings	10.50 to 11.00
Cast iron borings	9.00 to 9.50
Short shoveling turnings	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	14.50 to 15.00
Cupola Grades:	
Steel rails less than 3 ft.	16.25 to 17.25
Steel rails less than 2 ft.	18.00 to 18.50
Angle bars, steel	15.25 to 15.75
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	16.00 to 16.50
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	17.50 to 18.00
Iron car axles	25.50 to 26.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought	12.00 to 12.50
No. 2 railroad wrought	10.50 to 11.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	12.00 to 12.50
No. 1 agricultural cast	12.00 to 12.50
Stove plate	11.50 to 12.00
Grate bars	11.25 to 11.75
Brake shoes	9.75 to 10.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Coke.—Consumers are freely contracting for by-product foundry coke at $8 a ton, local ovens. December shipments continue to show an increase over the rate in November.

Plates.—Formal orders have not been placed with car builders by the Rock Island and, as a result, the 75,000 tons of steel needed for these 5000 cars has not been scheduled with mills. This situation would be of little moment except for the fact that some rolling mill units in this district are urgently in need of immediate releases. About 14,000 additional cars may soon be ordered from Western shops. Of this number, about half have been formally inquired for. Local sellers of steel estimate that for the country as a whole not less than 21,000 cars are definitely planned for, and this figure does not include several large programs which have been made public, but on which actual inquiry is still some distance in the future. Among probable purchases are 5000 or more by the Chesapeake & Ohio and allied lines. Reports indicate that a substantial volume of plate business will come from oil producing centers. In the meantime, inquiries and purchases of plates for tank building are individually small and widely scattered. Local tank shops are moderately busy, but are actively seeking additional work. Fabricators in the Southwest are well engaged on old orders and a fair volume of new miscellaneous work. Deliveries are at close range on most plate mill products. Prices are steady at 2c., Chicago.

Reinforcing Bars.—This market remains quiet in awards, and only slight encouragement is afforded by a nominal increase in new tonnages being estimated. New requests for prices in November were for about one-half the tonnage normally expected in that month. Activity by architects leads sellers to anticipate a normal market soon after the turn of the year. This would mean estimates on 8000 to 10,000 tons a month, with sales approximating 70 per cent of these figures. Price structures in this market are low, and, though repeated efforts have been made to put into effect higher quotations, results so far obtained have not been successful.

Factory Earnings Lower

Average weekly earnings in representative New York State factories in October are reported at $30.08, by the State Industrial Commissioner. This includes all employees in office and shop. It represents a recession from the $30.47 of September, which was the highest ever recorded, but is correspondingly higher than the $29.78 of October, 1928. No month previous to last December had ever reached $30.

New York

Pig Iron Sales Increase, Mostly for Early Shipment—Steel Volume Shows No Gain

NEW YORK, Dec. 10.—Pig iron sales have increased, totaling 8000 tons, compared with 5000 tons in the previous week. Part of the tonnage was for spot shipment. The General Electric Co., for example, closed against an inquiry for 500 tons for Bayway, N. J., and 200 tons for Schenectady, N. Y., for early delivery. The Pequonnock Foundry, Inc., Bridgeport, Conn., on the other hand, has bought 600 tons of foundry iron for first half shipment. Inquiries for about 3000 tons for first quarter are pending, but in general there are few definite requests for prices for that period, although a number of buyers have manifested some interest in tonnage for next year. Shipments to melters are declining as year-end shutdowns for inventory-taking approach. The recession is not due to suspensions, which have been exceptional, but rather to the fact that buyers are not placing additional orders to supplement those on which they have already received deliveries. Stocks on melters' yards are apparently very light. Buffalo iron is still available at $17 to $17.50, base furnace, for foundry grade, while Alabama foundry iron is being sold at $13.50, base Birmingham. The trade regards a concession from the latter price a possibility on a large tonnage. The Roane Iron Co., Rockwood, Tenn., contemplates blowing out a furnace shortly.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.91 to $22.41
*Buff. No. 2, del'd east. N. J.	20.28 to 20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Local district sales offices report that consumers are showing little interest in anticipating requirements. In view of the fact that the semi-annual inventory period is close at hand and that the price situation holds no incentive for forward buying, the dullness of the market is not surprising. Plates are fairly firm at 2c. to 2.05c., Coatesville, and bars are quoted at 1.90c., Pittsburgh. Demand for structural steel has slackened, although considerable work is pending. Much of this, however, probably will not be let until after the turn of the year. Structural awards in the metropolitan New York area, exclusive of civil engineering projects, totaled 43,905 tons in November, according to figures compiled by the Structural Steel Board of Trade. While this represents a sharp drop from the 85,699 tons in October, it is considerably larger than the 27,500 tons in November, 1928, and is a moderate gain over November, 1927, in which contracts were closed for 34,000 tons. A small amount of galvanized sheet business is being booked for delivery early in the first quarter at 3.40c., Pittsburgh, to large jobbers and 3.50c. to small users. Black stock is holding at 2.75c. and blue annealed at 2.35c., Pittsburgh, for No. 13 gage and 2.20c. for No. 10.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.09½c. to 2.14½c.; bar iron, 2.14c.

Reinforcing Bars.—Sales have been affected by the seasonal dullness, although considerable work is pending. Two jobs requiring 500 tons of bars each, an incinerator plant at New Haven, Conn., and a warehouse at Newark, N. J., were awarded the past week. The city of Albany, N. Y., has taken bids on 1000 tons of bars for a new waterworks. Prices are unchanged at 2.05c., New York.

Cast Iron Pipe.—Current buying of pressure pipe is still limited to carload lots or less, and prices are irregular. Hartford, Conn., has closed on 200 tons of 12-in. water pipe with a Birmingham maker. Portland, Me., is inquiring for about 400 tons of water pipe for delivery during 1930. Northern foundries are still fairly well engaged on large sizes of pipe, with orders sufficient to maintain present operating rates beyond the first of the year. Capacity for the smaller specifications, however, is far from filled, and little new business is being booked in these sizes.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—Contracts for delivery of by-product coke over the first half of next year are still being closed, but the market for prompt shipment continues quiet. The price of special brands of beehive foundry coke continues at $4.85 a net ton, ovens, or $8.56 delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. Standard furnace coke is quiet at $2.65 a net ton, Connellsville. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Warehouse Business.—The number of orders placed with jobbers continues fairly large, and in the past week individual tonnages have increased slightly. Demand for structural steel is small and the market for sheets is inactive. Quotations on black and galvanized sheets are only occasionally shaded, but blue annealed sheet prices still show a wide range.

Old Material.—Consumer buying of scrap is small and prices show a continued downward trend. Brokers have reduced their buying prices for No. 2 heavy melting steel for a consumer at Phoenixville, Pa., to $11.50 a ton, delivered, and are not offering more than $13.50 a ton, delivered, for heavy breakable cast for mills at Harrisburg, Bethlehem and Coatesville, Pa., or the foundry consumer at Florence, N. J. Specification pipe is still being bought at $13.50 a ton, delivered Lebanon, Pa., but in certain cases brokers have reduced their buying price for this de-

Donner-Witherow Merger Is Consummated

Consummation of the merger of the Donner Steel Co., Buffalo, and the Witherow Steel Corporation, Pittsburgh, was authorized by Donner stockholders at a meeting in Buffalo Monday. They also authorized a change in the capital structure of the company to provide for the transaction. Stockholders of Witherow gave their approval of the consolidation late last week by the deposit of sufficient stock to carry out the terms. Combined assets of the two companies will be approximately $34,000,000.

Sheet and Tube Takes Out Continuous Mill License

The Youngstown Sheet & Tube Co. has taken out a general license for use of the continuous rolling mill patents of the American Rolling Mill Co., marking another step by the company in plans to completely modernize its Youngstown and Chicago district properties. James A. Campbell, chairman, signed the licensing agreement this week.

This is the seventh such agreement made by the American Rolling Mill Co. with steel companies.

Cleveland

Demand for Automobile Steel Improves, Though Volume is not Large—Mill Operations Unchanged

CLEVELAND, Dec. 10.—Quite an improvement in the demand for steel from the automotive industry in the Detroit territory developed during the week. Some good business came from that source in steel bars, sheets and hot-rolled strip. While it is still expected that it will be some time after the first of the year before the automotive industry gets back to fair operations, the production of some of the lower-priced cars is being increased slowly on the changed models.

Orders for steel from automobile makers were in such low volume for several weeks that a release of more tonnage was not surprising. While automobile manufacturers are ordering only for early requirements, some of them are beginning to show an interest in first quarter contracts.

Two of the larger car manufacturers have inquiries out for steel bar contracts covering their requirements for the quarter and two other inquiries aggregate 7500 tons. One consumer in this field has placed a contract for a fair tonnage.

Orders from consumers outside the automotive field continue very light. Consumers in all fields are reducing their stocks to a minimum for inventory time and, with exceptions noted, are showing no inclination to place first quarter contracts. Present prices have been reaffirmed on practically all steel products, but mills are doing little in the way of soliciting contracts.

Finishing mill operations in this territory show little change from a week ago. Local independent steel plants continue to operate at about 30 per cent of capacity.

Pig Iron.—Consumers are showing more interest in first quarter contracts than heretofore and inquiry has gained. Cleveland interests sold 15,500 tons of foundry and malleable iron during the week, some for early requirements, but largely for first quarter delivery. The business was well distributed among districts, but not much of it came from the automotive industry. Inquiries totaling 3000 to 4000 tons are pending in the northern Ohio territory. Some buyers are showing hesitation about placing contracts for the coming quarter, both because of uncertainty as to how much iron they will need and because they are satisfied prices will be no higher, and they see a possibility of a reduction. Shipments continue light and are not expected to show an improvement this month, as many consumers will shut down their plants for inventories in the latter part of the month and probably will discontinue taking iron. No price weakness is in evidence. Foundry and malleable iron are quoted at $18.50, Cleveland, for out-of-town shipment and $19, furnace, for local delivery. The Michigan market is represented by a spread of $19.50 to $20.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25		$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.51 to	20.51
Malleable		19.50
Ohio silvery, 8 per cent		28.00
Basic Valley furnace		18.50
Stand. low phos., Valley	26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6.01 from Birmingham.

Iron Ore.—The dock balance of Lake Superior ore at Lake Erie ports Dec. 1 was 6,489,612 tons, as compared with 6,454,126 tons on the same date a year ago. Receipts at Lake Erie ports during the season were 45,747,079 tons, and shipments were 32,907,221 tons. Receipts at other than Lake Erie ports, mostly South Chicago, Gary and Indiana Harbor were 18,766,379 tons, as compared with 16,484,805 tons last year.

Sheets.—With quite a little business from the automotive industry in new orders, specifications against contracts and releases of held-up material, the market was more active the past week than for some time. The orders were not for large lots and were limited to early requirements. Some automobile body sheets were placed for January shipment because of the length of time it takes to furnish this grade. Specifications from barrel manufacturers also showed a gain. Independent mills in this territory are operating at 40 to 50 per cent of capacity, or at about the recent average. No interest is being taken in first quarter contracts. Some producers have taken a firmer stand on blue annealed sheets, and jobbing mills are holding to 2.20c. for No. 10 and 2.35c. for No. 13 in widths that do not have to meet continuous mill competition. On competitive material, a $2 a ton lower price is commonly prevailing. A quotation of 2.60c. on black sheets was made by one mill during the week for immediate specifications. Galvanized sheets are steady at 3.40c. Metal furniture sheets, about which there was some price uncertainty, are now commonly quoted at 4c. Some mills had attempted to hold to 4.10c. for the first quarter.

Bolts and Nuts.—Cleveland bolt and nut manufacturers have reestablished the present 70 per cent discount for the first quarter and reaffirmed stove bolt prices. Makers specializing on large bolts are doing much better than manufacturers of small bolts, the demand for the latter still being very dull.

Wire Products.—Concessions from the 2.40c., Cleveland, price on wire

have appeared in some sections. Leading makers are not meeting this price. Both nails and wire are very dull.

Bars, Plates and Shapes.—The volume of business in this territory continues light. Mills that have fourth quarter contracts expiring Dec. 15 will have considerable tonnage on their books to be cancelled or extended into the first quarter. Local plate mills are fairly well situated, having orders from locomotive builders. Detroit, which recently placed 1600 tons for a water pipe line, has an inquiry out for another extension requiring 2000 tons of plates. In the structural field, a local award of 1000 tons was made, but there is virtually no new inquiry. Local fabricating shops are still comfortably filled, but are reducing their backlogs. Although 1.85c., Cleveland, is being named for steel bars, outside mills are still quoting 1.90c., Cleveland. Plates and structural shapes are 1.90c., Pittsburgh. These prices are being named for the first quarter.

Coke.—Activity in foundry coke is light, being limited to specifications against contracts. Better grades of Connellsville foundry coke are unchanged at $4.85. Ohio by-product foundry coke is $8.25, ovens. Domestic heating coke is rather quiet following a spurt during the recent cold spell.

Rivets.—The leading local producer has reaffirmed for the first quarter present prices of $3.10 a 100 lb., Pittsburgh and Cleveland, for large rivets and 70 and 10 per cent off list for small rivets. Specifications are only moderate.

Strip Steel.—Specifications for hot-rolled strip increased during the week. Not only were there some fair releases from the automotive industry, but a better volume of orders from other consumers, including agricultural implement and hardware manufacturers. While there are occasional reports of concessions of $2 a ton, the market is holding rather firm at 1.90c., Pittsburgh, for wide strip and 2c. for narrow, and these prices are being paid by some of the larger consumers. Demand for cold-rolled strip continues very slow. This product is firm at 2.75c., Cleveland and Pittsburgh.

Semi-Finished Steel.—Specifications for sheet bars picked up the past week. Orders included one for 2000 tons for prompt shipment from a manufacturer of automobile body sheets. Demand for slabs and billets continues very light. No interest is being taken in first quarter contracts. Shipments of sheet bars, billets and slabs are being made against $35 contracts.

Old Material.—The market continues almost at a standstill. Mills in the Cleveland and Valley districts are taking very little scrap. One Cleveland consumer that for some time had been taking neither steelmaking nor blast furnace scrap is now accepting limited quantities of blast furnace grades. The market is weak and untested. While car lots are moving at concessions, yard dealers are inclined to hold their stocks until next month when they look for more activity and better prices.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	13.50 to 13.75
Compressed sheet steel	13.50 to 14.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	11.50 to 12.00
Machine shop turnings	9.00 to 9.75
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.00 to 13.50
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	12.50 to 13.00
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.00 to 10.50
Mixed borings and short turnings	10.00 to 10.50
No. 2 busheling	10.00 to 10.50
Cupola Grades:	
No. 1 cast	16.00 to 16.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.50
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Philadelphia

Railroads Inquire for Steel and Pig Iron—Heavy Plate Tonnages Required For Ships

PHILADELPHIA, Dec. 10.—Steel mill operations still show a tendency to decline, with a minimum of new business being placed and only small backlogs on mill books. Prices, however, have shown no further recession, and current quotations are in most cases being announced by mills for first quarter contracts. Meanwhile, the railroads and shipbuilding are providing most of the year-end activity. Recently, eastern Pennsylvania manufacturers of refrigerating machinery have been increasing their operating schedules, and wire rope makers are busier as a result of demand from public utilities.

The Baldwin Locomotive Works has booked orders for a total of 30 locomotives, of which 26 were from railroads and four from steel companies. The Norfolk & Western and the Chesapeake & Ohio are each taking bids on 2500 tons of plates, shapes and bars for first quarter delivery, and the Seaboard Air Line is also asking prices, but does not specify the tonnage. The Atlantic Coast Line Railroad has awarded 23,000 tons of rails to the Bethlehem Steel Co.

Shipbuilding activity continues an important factor. The Tidewater Oil Co. has awarded two 13,000-ton tank ships to the Sun Shipbuilding Co.; the Lake Tankers Corporation has placed nine barges with an Eastern shipyard; the Standard Oil Co. of New Jersey, which has recently placed contracts for eight tank ships, will award four more by the end of this month, and the Grace Line is contemplating construction of one to four vessels.

Ferromanganese.—Consumers are contracting for their 1930 requirements at $100 a ton, seaboard, and shipments on uncompleted contracts for this year are being made at the new price.

Pig Iron.—Small tonnage foundry iron inquiries for first quarter delivery are beginning to appear, but forward buying has not developed to any extent. Eastern Pennsylvania furnaces are generally maintaining $20.50 to $21 a ton, on foundry grade, with occasional concessions on desirable business. The Coatesville Boiler Works, Coatesville, Pa., is about to close on 250 tons of foundry iron for first quarter. The Norfolk & Western Railroad is inquiring for 1250 tons of No. 1, No. 2, No. 3 foundry and Bessemer malleable iron for delivery in the first quarter. The Newport News Shipbuilding & Dry Dock Co. has closed on a carload of foundry iron. Basic iron is apparently lacking in strength, a recent purchase by an Eastern consumer of about 1500 tons having been made at between $19.50 and $19.75 a ton, delivered.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.50 to 19.75
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.00 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Eastern Pennsylvania consumers of bars are moderately active in buying small lots, usually of less

than a carload. Quotations on this business and for first quarter contracts are firm at 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia.

Reinforcing Bars.—Bids have been asked for by the Pennsylvania Railroad on two slaughter houses in West Philadelphia, requiring a total of 1500 tons of bars. Prices show no improvement. Distributers claim to have been quoted 2.10c. a lb., delivered, by importers of reinforcing bars. Billet steel bars from domestic mills are quoted at 1.95c. a lb., Pittsburgh, or 2.27c., delivered Philadelphia, with the usual extra for cutting to length omitted. Rail steel bars range from 1.80c. to 1.95c. a lb., Franklin, Pa., and Tonawanda, N. Y., or 2.12c. to 2.27c., delivered Philadelphia, with no extra for cutting to length or bending.

Shapes.—Mills are maintaining fair rates of operation, but are booking only a small tonnage of new business. Prices are unchanged at 1.90c. to 1.95c., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c., delivered Philadelphia, with concessions of about $1 a ton sometimes granted on desirable tonnages. Fabricating shops are bidding on only a small tonnage of new projects. At the opening of bids today for the general contract on the convention hall in Philadelphia, McCloskey & Co. were low.

Plates.—Current buying is limited in most cases to small lots, usually of less than a carload, but mills are quoting on some substantial tonnages of plates to shipyards, and railroad business for next year is beginning to appear. One eastern Pennsylvania plate mill has just resumed operation following a week's suspension for repairs and installation of new electrical equipment. On orders for prompt shipment and for first quarter contracts, plate mills are quoting 2c. to 2.05c. a lb., Coatesville, Pa., or 2.10c. to 2.15c., delivered Philadelphia.

Sheets.—Most consumers of sheets are still operating on restricted schedules, except for manufacturers of refrigerating machinery, which have been increasing production recently. Prices are substantially unchanged, with black sheets quoted at 2.70c. to 2.75c. a lb., Pittsburgh, or 3.02c. to 3.07c., delivered Philadelphia, and galvanized at 3.40c., Pittsburgh, or 3.72c., Philadelphia. Blue annealed sheets are quoted at 2.35c., Pittsburgh, or 2.67c., Philadelphia, for No. 13 gage, and blue annealed plates at 2.20c., Pittsburgh, or 2.52c., Philadelphia, for No. 10 gage. Concessions of $2 to $4 a ton are granted on orders from automobile manufacturers and other preferred buyers. Mills are also quoting these prices for first quarter contracts.

Imports.—In the week ended Dec. 7, 3513 tons of chrome ore was received at this port, of which 2033 tons came from Portuguese Africa and 1480 tons from Greece. A total of 699 tons of pig iron was received, of which 499 tons came from British India and 200 tons from Sweden, and 150 tons of spiegeleisen was received from the United Kingdom. Steel arrivals consisted of 34 tons of steel rods and 13 tons of steel billets from Sweden, 24 tons of structural shapes, 24 tons of steel bands and 9 tons of steel bars from France, 82 tons of structural shapes, 50 tons of steel bands and 15 tons of steel bars from Belgium, and 509 tons of steel scrap from the United Kingdom.

Old Material.—Consumer buying of scrap is still limited to small lots, and the large users of No. 1 heavy melting steel are not in the market. Although scrap prices are generally unchanged in the absence of buying, they are lacking in strength.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	$14.50 to	$15.00
Scrap T rails	14.00 to	14.50
No. 2 heavy melting steel.	12.00 to	13.00
No. 1 railroad wrought...	15.50 to	16.00
Bundled sheets (for steel works)		11.50
Hydraulic compressed, new	13.50 to	14.00
Hydraulic compressed, old.	12.00 to	12.50
Machine shop turnings (for steel works)		11.00
Heavy axle turnings (or equiv.)	12.50 to	13.50
Cast borings (for steel works and roll. mill)...	11.00 to	11.50
Heavy breakable cast (for steel works)		14.00
Railroad grate bars.....	11.50 to	12.00
Stove plate (for steel works)	11.00 to	11.50
No. 1 low phos., hvy., 0.04% and under.....	21.00 to	22.00
Couplers and knuckles.....	19.00 to	19.50
Rolled steel wheels.....	19.00 to	19.50
No. 1 blast f'nace scrap..	10.50 to	11.00
Wrot. iron and soft steel pipes and tubes (new specific.)		14.00
Shafting		19.00
Steel axles	20.00 to	21.00
No. 1 forge fire	13.00 to	13.50
Cast iron carwheels.....	15.50 to	16.00
No. 1 cast	15.00 to	15.50
Cast borings (for chem. plant)	14.00 to	14.50
Steel rails for rolling.....	16.00 to	16.50

More Pig Iron Imported in October

WASHINGTON, Dec. 6.—Supplying 8846 gross tons, or 63 per cent of all, British India was the chief source of pig iron imports in October, totaling 14,295 tons. Canada ranked second, furnishing 3809 tons, an unusually large tonnage from that country. It represented more than the total from Canada during the preceding nine months, which was only 3472 tons.

For the 10 months of 1929, imports of pig iron were 117,889 tons, a decrease of 996 tons from the 118,885 tons imported in the first 10 months of 1928. India supplied 53,117 tons of the 1929 imports, leading all other countries, while the United Kingdom ranked second, with 31,903 tons. In the 10 months of 1928, the situation was the reverse, the United Kingdom being the leading source of importations, with a total of 47,254 tons, while India was second, with 42,637 tons. Netherlands was third, both years.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT
(In Gross Tons)

	October		10 Months Ended October	
	1929	1928	1929	1928

Total	14,295	14,108	117,889	118,885

Moves from Building Occupied for 70 Years

The Mackintosh-Hemphill Co., Pittsburgh, has moved its general offices and engineering department from a building in that city it had occupied for 70 years. The old property, at the foot of Twelfth Street, has been sold to the Pennsylvania Railroad for terminal improvements. The company has occupied offices in the Point Building, Penn Avenue and Water Street.

This company, which has played an important role in the development of the iron and steel industry through its engineering and production work in steel plant and rolling mill equipment, traces its history back farther than 1859, when James Hemphill, Dr. W. S. Mackintosh and N. F. Hart acquired a small shop at the site just relinquished by the present company. In 1803, the Pittsburgh Foundry, the first foundry in Pittsburgh, was started by Joseph McClurg. A. Garrison & Co. succeeded to its ownership in 1865. Calvin Adams established another foundry in 1837, which successively was known as the Jarvis Adams Co. and the Pittsburgh Iron & Steel Foundries Co. Mr. McClurg and his son, Alexander, had established the Fort Pitt Works 12 years after their initial foundry venture, and in 1878 this company was acquired by James Hemphill and his partners to take care of their increasing business. The A. Garrison Foundry Co., Pittsburgh Iron & Steel Foundries Co., and Woodard Machine Co. were merged with the Mackintosh-Hemphill Co. in 1922, the Woodard company having been established by the Mackintosh-Hemphill organization six years previous at Wooster, Ohio.

All of these plants are rich in industrial history. The old Pittsburgh Foundry furnished cannon balls for Perry's fleet in 1812. The first locomotive built west of the Alleghenies was a product of the Fort Pitt Works. Civil War ordnance was made at all of the plants.

Birmingham

Pig Iron Buying Slow—Steel Backlogs Aided by Railroad Buying—Scrap Market Dull

BIRMINGHAM, Dec. 10. — Neither buyers nor sellers in this district seem to be much interested in first quarter iron. A few of the smaller consumers in the district have offered to buy first quarter iron, but furnace interests have not opened their books. In general, the unshipped balance, of fourth quarter contracts is more than ample for the remainder of the month, and buying is expected to be small when books are opened for the new period. Books were opened three weeks ago at $14 to $14.50 for first quarter iron in competitive territories, and small tonnages from these districts are coming in. District prices remain on the basis of $14.50, Birmingham, for No. 2 foundry iron. Sixteen furnaces are active, the same as in the past three weeks. Of this number, nine are on foundry iron, six on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—It is estimated that backlogs of one of the larger companies are slightly better than they were 30 days ago, exclusive of new rail orders, and operations are equally as high. Decreases in some lines have been offset by increases in others. A feature of the market has been the well sustained demand for bars and plates. Railroad accessories have played an important part in maintaining backlogs. The lighter demand for sheets and wire products is attributed largely to the desire to reduce inventories. All prices are the same as last week. Of the 120,000 tons of rails ordered by the Southern Pacific, 30,000 tons will be rolled by the Tennessee company. The only order of importance for fabricated structural steel is 500 tons for a Southern Railway bridge at Augusta, Ga., booked by the Virginia Bridge & Iron Co. Several important projects are in prospect for early next year, including an office building and a hotel at Atlanta, each of 18 stories, and a 30-story hotel at Mobile, Ala. The Tennessee company is operating eight out of nine open hearths at Ensley, an increase of one, and six out of eight at Fairfield. The Gulf States Steel Co. continues to work all six at Alabama City.

Cast Iron Pipe.—The United States Pipe & Foundry Co. is reported to be low bidder on a large part of the 6500-ton project at Detroit, for which bids were opened last week. This company shared with the McWane Cast Iron Pipe Co. an order for several hundred tons of small sizes of pipe for Dallas, Tex. New bids are to be asked on upward of 2000 tons of large diameter pipe. Bids were opened last week and contracts are pending on projects at Memphis, Tenn., and Richmond, Va., totaling about 1400 tons. Inquiries from municipalities for their 1930 requirements are more numerous. Plant operations are at the low point of the year, averaging under 60 per cent in some cases. Makers continue to maintain base prices of $37 to $38 for 6-in. and larger sizes.

Old Material.—Sales declined considerably last week. Foundries have issued instructions to hold up shipments until after the inventory period. The larger mills continue to take some steel scrap, and this is about the only activity in the market. Prices on steel grades are softer, though quotations are unchanged. Iron scrap is too dull for prices to be well defined.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

Buffalo

Further Reduction of Active Blast Furnace Capacity in District—Steel Mill Operation Unimproved

BUFFALO, Dec. 10.—The pig iron market is quiet, although several medium-sized inquiries have come out, including one for 300 tons of foundry, one for 500 tons, and one for 600 tons, and there have been several orders of similar size. There have been some inquiries for the first quarter, but no real buying as yet. The Hanna Furnace Co. has taken another furnace out of blast, leaving two in operation, one of which is on silvery. It is reported that one of the Donner stacks may go out of blast soon. Shipments on old orders are very good and all of the business being taken is for spot delivery. Melters in various sections of the country appear to be anxious to obtain their iron on schedule and even ahead of schedule, with the result that furnace stocks are continuing to decrease.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.00 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—No increase is noted in the operation of Buffalo mills. The Lackawanna plant of the Bethlehem Steel Co. is operating 10 of its 24 open-hearths. Several of its mills are down and the rest are on single turn, with an average operation of 40 to 45 per cent. The Donner Steel Co. operation remains the same, with three open-hearths going four days a week. The Seneca Iron & Steel Co. is operating at approximately 40 per cent. The Wickwire-Spencer Steel Co. is operating three of four open-hearths, and the Gould Coupler Co. is operating three of four basic and one acid furnace. Fabricated structural steel lettings include 150 tons for an addition to the plant of the Carborundum Co., Niagara Falls, N. Y., and 300 tons for an Elmira school.

Old Material.—A purchase of No. 1 heavy melting steel at $14 by the largest interest in the district was made the past week. An inquiry is out for 500 tons of stove plate. Otherwise, the market is quiet, though some steel car axles have been sold at $16.50 to $17, and there have been a few scattered sales of knuckles and couplers, coil and leaf springs and rolled steel wheels at $18 to $18.50. One of the largest consumers in the district continues to suspend incoming shipments entirely.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	12.50 to 13.00
Scrap rails	14.75 to 15.25
Hydraul. comp. sheets	12.50 to 13.00
Hand bundled sheets	10.50 to 11.00
Drop forge flashings	12.50 to 13.00
No. 1 busheling	12.50 to 13.00
Hvy. steel axle turnings	12.50 to 13.00
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	10.50 to 11.00
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	10.75 to 11.25
Blast Furnace Grades:	
Short mixed borings and turnings	10.75 to 11.25
Cast iron borings	10.75 to 11.25
No. 2 busheling	8.00
Rolling Mill Grades:	
Steel car axles	16.50 to 17.00
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.00 to 12.25
Locomotive grate bars	10.00 to 10.50
Steel rails, 3 ft. and under	17.75 to 18.00
Cast iron carwheels	11.50 to 12.00
Malleable Grades:	
Industrial	16.50 to 17.00
Railroad	16.50 to 17.00
Agricultural	16.50 to 17.00
Special Grades:	
Chemical borings	12.00 to 12.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.

St. Louis

Pig Iron Melters Hold Purchases at a Minimum—Scrap Shipments Still Sharply Restricted

ST. LOUIS, Dec. 10. — The pig iron market continues quiet. Buying for immediate shipment is especially light, as melters are holding down their inventories of raw materials as much as possible. Only slight active interest is being taken in first quarter business. Heavy purchases made in the early fall and a falling off in the melt, especially among the stove foundries here and at Belleville and Quincy, indicate that some melters will carry over pig iron into the new year. Some melters, too, are said to be hesitant in placing orders for first quarter shipment because of uncertainty over the price situation. However, makers are optimistic and believe the turn of the year will bring a marked improvement in buying. Purchases of the week are reported to be less than 2000 tons.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.42 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Old Material.—The three largest district consumers of steel scrap still ask that shipments against contracts be withheld, while the railroads are urging the dealers to take material that has been purchased to fill contracts. Dealers are taking railroad shipments, and either are laying them down in their yards or finding other outlets at losses. Prices generally are unchanged because of an absence of sales. The only change is in machine shop turnings, which are off 50c. Railroad lists: Wabash, 3865 tons; Chicago, Rock Island & Pacific, 200 carloads; Great Northern, 49 carloads; St Louis-San Francisco, 26 carloads; Chicago & Western Indiana, 17 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.00 to $13.50
No. 2 heavy melting or shoveling steel	12.00 to 12.50
No. 1 locomotive tires	14.50 to 15.00
Misc. stand.-sec. rails including frogs, switches and guards, cut apart	14.00 to 14.50
Railroad springs	15.50 to 16.00
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.75 to 10.25
Cast iron borings and shoveling turnings	9.25 to 9.75
Iron rails	13.00 to 13.50
Rails for rolling	15.00 to 15.50
Machine shop turnings	6.75 to 7.25
Heavy turnings	9.50 to 10.00
Steel car axles	18.00 to 18.50
Iron car axles	27.00 to 27.50
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.00 to 17.50
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	13.50 to 14.00
No. 1 railroad cast	14.50 to 15.00
Stove plate	11.75 to 12.25
Agricult. malleable	14.00 to 14.50
Relay. rails 60 lb. and under	20.50 to 23.50
Relay. rails 70 lb. and over	26.50 to 29.00

Canada

Large Structural Steel Demands Expected

TORONTO, ONT., Dec. 10.—Blast furnace representatives have opened their books for first quarter business, but so far there have been only small bookings. Local representatives look for good business to start in about a week or ten days. Spot buying is holding at a satisfactory level. The melt is unchanged at an average of better than 80 per cent. Pig iron prices are unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10

No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Structural Steel.—Deliveries against contract are responsible for continued activity among fabricating plants in Canada. Although the demand at the moment is off, with only small tonnages being closed, large tonnage business is in prospect for closing early in the new year. Several large structures have been announced in Montreal, for which about 15,000 tons of steel will be required. In British Columbia, two or three large buildings will require 3000 to 8000 tons each, while bridge construction in that district will involve about 12,000 tons of steel. Other substantial tonnages are pending for Western cities. Taken as a whole, the prospective structural demand will call for upward of 50,000 tons, and much of this will be closed before spring.

Old Material.—A temporary flurry brought a better demand for iron and steel scrap during the week. The improvement was confined to iron grades and was due to the fact that a number of hand-to-mouth buyers were forced into the market for immediate requirements. Some of the large consumers appear to be getting ready to place first quarter contracts. Dealers have made no revision in prices.

Dealers' buying prices:

	Toronto	Montreal

New Sheet Mill to Be Built Near Pittsburgh

The Tarentum Steel Corporation, organized several months ago in Pittsburgh, will begin the construction of a new steel plant at Tarentum, Pa., soon after Jan. 1, according to an announcement of V. L. McClay, secretary. The mill is to be erected on the site of the old No. 2 plant of the Pittsburgh Plate Glass Co., and work of dismantling the old buildings is rapidly being completed. The new plant is to contain six complete sheet mills and will have an annual capacity of 55,000 to 65,000 tons of full finished sheets.

Ray P. Farrington, formerly vice-president and treasurer of the Heintz Mfg. Co., Philadelphia, is president of the Tarentum Steel Corporation; William Cole is vice-president in charge of operation, and Frank Irvine, treasurer.

The M. M. Rivard Co., Gumbel Building, Kansas City, Mo., has been appointed sales representative for western Missouri and Kansas by the Bradley Washfountain Co., Milwaukee. L. M. Bartlett Co., 286 Baker Building, Minneapolis, has been placed in charge of sales in Minnesota, North Dakota and that section of Wisconsin tributary to the Twin Cities.

Cincinnati

Pig Iron Sales Decline Further but First Quarter Inquiries Appear—Scrap Dull and Weak

CINCINNATI, Dec. 10.—Although the district demand for pig iron slackened still further last week, the receipt of two sizable inquiries for first quarter contributed some optimism to the market. The larger inquiry is from an unnamed railroad for 1250 tons and the other is from a central Ohio consumer for 500 to 1000 tons. Total sales last week were approximately 1850 tons, of which 300 tons was silvery, bought by a Michigan consumer. Since district users of pig iron have been purchasing in hand-to-mouth proportions during this quarter and have accumulated no inventories, it is expected that the demand will improve after the first of the year, when buyers will be forced into the market to supply their needs. Prices on both Northern and Southern iron are being well maintained.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The sheet market recovered slightly last week from the recession of the preceding three weeks. While output has not been advanced beyond 50 to 55 per cent of normal operation, the demand last week exceeded the present production schedules.

Old Material.—With mills still curtailing shipments of scrap and new business quiet and small, dealers are bidding more closely on all grades than they did a week ago and are offering 25c. less on heavy melting steel and No. 2 wrought and 50c. less on cast iron carwheels. The Southern Railway and the Chesapeake & Ohio are offering their usual lists. The Louisville & Nashville has sent out a list of 6500 tons.

Warehouse Prices, f.o.b. Cincinnati

Railroad malleable	15.00 to 15.50

Youngstown

Better Buying Expected from Automobile Makers

YOUNGSTOWN, Dec. 10.—Sentiment in the steel industry here is considerably better than it was last month. The automotive industry is beginning to show interest in its January requirements, and reports from the Michigan companies are encouraging. New orders and specifications have shown no increase, but there has been no further decline in tonnage releases and mill operations are on a more even keel. Ingot operations are at a very low point, as less than 20 of the 53 available open-hearth furnaces in the district were operated all of last week. However, the Ohio laws provide for a tax on year-end raw materials' inventories, and steel makers might be expected to reduce reserve tonnage to a minimum at this time. Operations of finishing mills are at a better rate, with sheet and strip mills operating at 40 to 50 per cent of capacity and bar pipe mills averaging slightly better. The average for bars is improved slightly by the somewhat higher rate of the Steel Corporation subsidiary. Tin mills average about 60 per cent, with increases in prospect before the end of the month. Local steel consumers are largely responsible for the maintenance of steel output at present levels, as little or no steel is now going to the automobile industry.

Sheet prices have a better tone in this district, although competition from other centers is still a threat to the existing schedules. Blue annealed sheets and light plates are again established at 2.35c. and 2.20c., Pittsburgh, respectively, but wide strip mills are quoting $4 a ton less, with jobbing mills making no efforts to meet this competition. Black sheets are still at 2.75c., Pittsburgh, although some buyers report lower quotations. In fact, if the reports of buyers are to be given full credence, lower quotations are being made on many products, but mills are usually unable to trace such statements and in the meantime are making no efforts to push first quarter buying. Automobile body and metal furniture sheets are holding at 4c., Pittsburgh, and the 4.10c. quotation on the latter has not disappeared. On galvanized sheets, 3.40c. seems to be the minimum, and 3.50c. is the general quotation on first quarter tonnage. Bars are unchanged at 1.90c., Pittsburgh, although a Cleveland mill is reported to be making lower quotations on some business in this territory. Prices on strip steel are subject to pressure, but the regular quotations are not seriously threatened.

On primary materials, the price situation is not essentially changed. Sheet bars apparently are settling to $34, Pittsburgh or Youngstown, but mills are currently quoting $35 in the face of lack of first quarter buying. Billet and slab prices are also nominal and have not been established at lower levels by actual sales. One seller of merchant pig iron has opened first quarter books at unchanged prices, or $18.50, Valley, on basic and foundry iron, and $19 on Bessemer and malleable. The market is very quiet. Scrap prices are still settling, with No. 1 heavy melting steel quotable around $15 and hydraulic compressed sheets at 50c. less.

Boston

Pig Iron Sales Small, Scrap Market Dull

BOSTON, Dec. 10.—Pig iron sales the past week were confined to scattered lots, a majority of them at, or the equivalent to, $17.50 to $18 a ton, Buffalo, for No. 2X. Foundries say customers are holding up orders, and many foundries are melting considerably less iron than they were a month ago. It is estimated at least 70 per cent of foundries have sufficient iron on hand or on order to carry them past Jan. 1. Textile machinery

manufacturers, now the largest consumers of pig iron in New England, have slowed up. All of them recently purchased large tonnages of Alabama iron and will require only small tonnages for mixture purposes during the next three months. A Massachusetts heater manufacturer has indicated iron will be bought before Jan. 1, but the tonnage is not specified.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$21.91 to $22.91
*Buffalo, sil. 2.25 to 2.75	21.91 to 22.91
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65

†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates; $4.91 all rail from Buffalo; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Old Material.—Pennsylvania steel mills are holding up what few orders shippers have in hand, and the scrap market is exceptionally quiet. There is a market for steel turnings or steel mill borings at $6 to $6.10 a ton, on cars shipping point, but comparatively little of these materials is available. A Worcester, Mass., steel mill is taking small scattering tonnages of long bundled skeleton at $10.50 a ton, delivered, for which brokers are paying $8 to $8.50, on cars. A steamer is scheduled to leave here this week with 3000 tons of scrap for Danzig.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.50 to $10.00
Scrap T rails	9.00 to 9.75
Scrap girder rails	8.50 to 9.00
No. 1 railroad wrought	10.50 to 10.75
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	5.50 to 6.10
Cast iron borings (steel works and rolling mill)	6.00 to 6.10
Bundled skeleton, long	8.25 to 8.50
Forge flashings	8.00 to 9.00
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	8.50 to 9.00
Shafting	13.50 to 14.00
Steel car axles	15.00 to 15.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	8.50 to 9.00
Rails for rolling	10.50 to 11.00
Cast iron borings, chemical	9.00 to 9.50

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

German Hardware Makers Assured Bounties

HAMBURG, GERMANY, Nov. 18.—Certain German hardware manufacturers have entered into private export bounty agreements with the steel producers, the agreements to become effective if the German steel cartels are not renewed. The manufacturers of hardware regard such arrangements essential to the maintenance of their export trade, while the steel mills are willing to pay the export bounties as a means of preventing manufacturers from buying Belgian or Luxemburg steel, on which they pay no duty if the finished product is exported.

Fabricated Structural Steel

Awards Total 35,000 Tons—Largest Inquiry Is For 18,700 Tons For New York Subway

CONTRACTS were placed in the past week for 35,000 tons of fabricated structural steel, of which 20,000 tons will go into buildings for non-industrial purposes and 11,000 tons into the construction of bridges. The largest awards were 6270 tons for a railway bridge at Cincinnati and 6000 tons for a hotel addition at Toronto. A New York subway section, needing 18,700 tons of steel, accounts for about three-fifths of the new work, totaling 31,000 tons, which came out for bids during the week. Awards follow:

WATERTOWN, MASS., 175 tons, Hood Rubber Co. vulcanizing plant, to A. L. Smith Iron Works.

BOSTON & ALBANY RAILROAD, 150 tons, power house in Allston District, Boston, to Eastern Bridge & Structural Co.

INWOOD, VT., 1000 tons, bridges for Connecticut River Power Co., to McClintic-Marshall Co.

NEW YORK, 700 tons, apartment building at 865 First Avenue, to Paterson Bridge Co.

NEW YORK, 4500 tons, addition to City Bank Farmers Trust Co., to McClintic-Marshall Co.

EDGEWATER, N. J., 445 tons, Ford assembly plant viaduct, to McClintic-Marshall Co.

EASTON, PA., 700 tons, building for Lehigh Telephone Co., to Bethlehem Construction Co.

LANCASTER, PA., 800 tons, telephone building, to Shoemaker Bridge Co.

STATE OF MARYLAND, 150 tons, highway bridge, to Dietrich Brothers.

ELMIRA, N. Y., 300 tons, school, to Kellogg Structural Steel Co.

JERICHO, N. Y., 700 tons plates, tanks for Jericho Water District, to Pittsburgh-Des Moines Steel Co.

NIAGARA FALLS, N. Y., 135 tons, addition to plant of Carborundum Co., to McClintic-Marshall Co.

TORONTO, 6000 tons, addition to Royal York Hotel, to Dominion Bridge Co.

LANSING, MICH., 345 tons, Grand River bridge for city, to Bethlehem Steel Co.

LANSING, 700 tons, R. E. Olds Bank, to R. C. Mahon Co.

CLEVELAND, 1000 tons, Severance Hall, to Massillon Bridge & Structural Co.

CINCINNATI, 6270 tons, White River bridge for Cincinnati Union Railway, to American Bridge Co.

PITTSBURGH, 900 tons, building for McCann & Co., to American Bridge Co.

BATON ROUGE, LA., 450 tons, river crossing towers for Baton Rouge Electric Co., to American Bridge Co.

FORT WAYNE, IND., 250 tons, building for General Electric Co., to American Bridge Co.

SPRINGFIELD, ILL., 350 tons, Monarch Tractor Co. building, to Illinois Steel Bridge Co.

CHICAGO, 300 tons, building for Mundelein College, to Hansell-Elcock Co.

CHICAGO, 1800 tons, Fine Arts building, to Hansell-Elcock Co.

CHICAGO, 536 tons, North Dearborn Street substation for Commonwealth-Edison Co., to McClintic-Marshall Co.

PEORIA, ILL., 400 tons, highway bridge, to Continental Bridge Co.

CHICAGO, BURLINGTON & QUINCY, 400 tons, bridge work, to Vierling Steel Works, Chicago.

ST. PAUL, 1815 tons, Third Street viaduct, to St. Paul Foundry Co.

MILWAUKEE, 700 tons, plates, tanks for Milwaukee County, to Pittsburgh-Des Moines Steel Co.

LINCOLN, NEB., 400 tons, power house, to Pittsburgh-Des Moines Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PHILADELPHIA, 6800 tons, convention hall, low bidder for general contract, McCloskey & Co., Philadelphia.

MIDDLETOWN, CONN., 250 tons, foundry and boiler house.

CAMBRIDGE, MASS., 100 tons, Jordan & Marsh storage warehouse addition.

NEW YORK, 2000 tons, apartment building at Central Park West and Sixty-sixth Street.

BROOKLYN, 18,700 tons, subway, Route 109, Section 3.

BALTIMORE, 4000 tons, postoffice.

CHICAGO, 100 tons, dock house at Sixteenth Street and Chicago River.

STATE OF MICHIGAN, 168 tons, two bridges for State Highway Department.

HASTINGS, MINN., 400 tons, highway bridge.

ST. PETER, MINN., 400 tons, highway bridge.

ST. LOUIS, 1400 tons, factory for Steel Frame House Co.

SAN ANTONIO, TEX., 4500 tons, Army Air Service, hangars for Randolph Field; bids to be asked.

Central Alloy Formally Takes over Interstate

Acquisition of the Interstate Iron & Steel Co., Chicago, by Central Alloy Steel Corporation, Massillon, Ohio, has become effective with the transfer of Interstate assets, it is announced by F. J. Griffiths, chairman of Central Alloy. Work of coordinating sales and production activities of the two companies will begin at once, Mr. Griffiths said.

With the acquisition of the Interstate properties, assets of Central Alloy Steel Corporation are increased approximately $17,000,000 to a total of more than $92,000,000. Total ingot capacity of the Massillon company will be 1,938,000 tons, including an addition of 396,000 tons representing Interstate's capacity. Interstate has three plants in East Chicago. Its properties include over 300 acres and one mile of frontage on the Calumet River.

Creative Spending Is Urged by Charles F. Abbott

It is no extravagance to spend money largely, but rather it is wasteful to be penurious, declared Charles F. Abbott, executive director of the American Institute of Steel Construction, in an address before the New England Foundrymen's Association at Boston Dec. 11. Industrial and commercial success, he said, has been predicated upon a courageous expenditure of funds and a willingness to be generous in all worthy efforts.

"We are discarding the old economic idea that business is limited," said Mr. Abbott. "We are rationalizing our industrial output in accordance with the ability of consumers to buy and are improving the consumer's purchasing powers. It is just as much industry's duty to make markets as it is to make goods.

"We must lift up an entire industry toward a higher average in tools, methods and business principles. We are willing to spend money to accomplish it—a great deal of money, individually and collectively. That is courageous and creative spending, the statesmanship of consumption and genuine progress.

"We are doing a greater and better job in advertising than we ever dreamed of doing in the old days," he said. "It is costing more money, but it is breaking down resistance, promoting bigger things because it is genuinely creative spending. The technical and industrial field is rapidly coming into the bigger sphere of usefulness, and he is a bold man who can predict where this era will end."

Factory Migration in Illinois

Forty-six cities in Illinois reported a gain of 261 plants and 13,411 employees between 1926 and 1927, according to a summary reported by the Illinois Manufacturers' Association, which compiled data from a nation-wide cooperative survey made by the civic development committee of the National Electric Light Association and the policyholders' service bureau of the Metropolitan Life Insurance Co.

This report shows that 193 were new plants, employing 5360 persons. Twenty-five were branch plants, employing 5391 persons and 43 were relocations, with 2660 employees. Of the 43 relocations in Illinois, 25 were from within the State, seven were from other States in the same section and eleven were from other sections of the United States.

The most frequently occurring reasons for the plant location in a definite place in the east-north central region, which includes Ohio, Michigan, Indiana and Wisconsin, as well as Illinois, were given as follows: market, transportation, labor materials, living conditions, available factory buildings, financial aid or investments, and near related industries.

Allis-Chalmers Mfg. Co. Has Large Unfilled Orders

Directors of the Allis-Chalmers Mfg. Co., West Allis, Wis., have placed the common stock on a $3 annual basis by declaration of a quarterly dividend of 75c. The previous annual payments were $2 per share. Unfilled orders of the company as of Nov. 30 totaled $13,600,000, as compared with $9,681,000 Jan. 1, 1929.

Steel Corporation's Orders Gain 38,783 Tons

For the third successive month a gain was reported for November in the unfilled orders of the United States Steel Corporation. It was small at 38,783 tons and compares with 183,981 tons in October and 244,370 tons in September. These three increases contrast with decreases in the previous four months. The total on Nov. 30 was 4,125,345 tons, as against 4,086,562 tons on Oct. 31. A year ago, or on Nov. 30, 1928, the unfilled orders were 3,673,000 tons.

Unfilled tonnage at the end of each month for the past three years follows:

	1929	1928	1927
November.	4,125,345	3,673,000	3,454,441
October ..	4,086,562	3,751,030	3,341,000

Austin Co. Plans Large Expansion Program

A widely increased program of activity both here and abroad, including a 20 per cent increase in its advertising budget over last year, will be undertaken in 1930 by the Austin Co., industrial engineer and builder, W. J. Austin, president, announced, following a convention in Cleveland attended by 75 district managers and sales engineers of the company from 16 cities throughout the country. The consensus of opinion of the members of the Austin managers was that 1930 will be a year of unusual building activities.

Among the new departures contemplated by the company in 1930 are these:

An extension of Austin activities into other European countries than Russia, in which reviving industries are anxious to adopt American industrial methods. This will be in addition to $40,000,000 contract for a complete automobile plant and model industrial city at Nishni Novgorod, Russia.

The extension of technological specialization by experts of the company from some half a dozen industries to more than a score of industries in the United States.

An increase of 20 per cent in advertising in newspapers and other mediums to take advantage of the increased industrial building opportunities which delegates to the convention predict in their districts for 1930. Mr. Austin indicated that if the necessity arose a still further increase would be made.

George A. Bryant, Jr., executive vice-president of the company, who last summer carried on the negotiations with the Soviet Government, said there were opportunities for American construction and industrial methods in other European countries, particularly Germany. He also intimated that the company had additional work in prospect in Russia.

Acme Steel to Increase Strip Steel Capacity

Directors of the Acme Steel Co. have voted a stock dividend of 25 per cent. This action will be subject to approval by stockholders of a proposed increase in capital stock from 300,000 to 500,000 shares.

The Acme Steel Co. is closing the most prosperous year in its history, according to a statement issued by James E. MacMurray, chairman of the board. During 1930 the company will install machinery to increase further the manufacture of strip steel. During the present year the company has installed new hot mill and a heavy four-high train of cold mills which will increase the plant output by 25 per cent.

Non-Ferrous Metal Markets

Copper Firmer But Inactive —Tin Very Dull—Lead Steady—Zinc Easier

NEW YORK, Dec. 10.

Copper.—Statistics for November will be published Thursday, Dec. 12, and the trade expects a large increase in stocks of refined metal. Practically the only buying is by foreign consumers, and this has ranged from 500 to 1000 tons a day, a small amount. It is estimated that consumers abroad have bought since Dec. 1 only about 14,000 tons, which is no more than half of what may be considered their present requirements. In November the sales were 32,000 tons and in October about 40,000 tons. Purchases are all hand-to-mouth, with metal afloat taken as soon as it arrives. There is even some demand for copper from warehouses over there. In the domestic trade, there is a little buying each day, but it is unimportant. This also is of a hand-to-mouth character and for immediate shipment. Curtailment at the mines is proceeding, but definite information as to the extent is difficult to obtain. It is admitted, however, that reduction of output is anywhere from 25 to 40 per cent, depending on the company. The effect of this will not be apparent for two or three months. It is evident that there is less expectation of a reduction in the price and there is less talk about it than there was recently. Quotations are firm at 18c., delivered in the Connecticut Valley, for electrolytic copper and 18.30c. c.i.f. usual European ports. Lake copper is very dull but unchanged at 18 to 18.12½c., delivered.

Tin.—Demand for tin is at low ebb. Consumers are considered as being well covered and are not doing any nearby buying. Because of approaching inventories, there is a disinclination to increase stocks. The only news feature is the advance this week in the London market. Quotations yesterday were up £4 5s. a ton and today there was an additional advance of £3 10s., so that quotations today were £181 for spot standard, £184 5s. for future standard and £184 10s. for spot Straits, all considerably higher than a week ago. These advances are said to be due to propaganda emphasizing a probable world-wide curtailment of output and also a report that the Federated Malay States have ordered a six-day week. Demand in this market is very light today and spot Straits tin is quoted at 39.62½c., New York, the advance

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

Cast aluminum	10.00c.	12.00c.

over recent prices being due to the effect of the London quotations.

Lead.—This is the most active market, but even so the quantity turned over is not large. There have been fair purchases for delivery this month and some inquiry for January, but commitments are limited to material that can be consumed this month so as to keep inventories low. The market at St. Louis is firm at 6.10c. and the contract quotation of the leading interest is unchanged at 6.25c., New York.

Zinc.—Conditions have changed little and buying is of a hand-to-mouth order. There is some slab zinc available under the quotation of most of the producers, but the quantity is limited. In fact, there is scarcely enough business to test prices, which are 6c., East St. Louis, or 6.35c., New York, the metal at concessions being available at 5.90c., East St. Louis. The ore price is unchanged at $38, Joplin. Although production is comparatively low, it is regarded as in excess of demand and the situation is unsatisfactory for both miners and smelters. The opinion is expressed that a further reduction in price is probable.

Antimony.—In a dull market Chinese metal for spot and future delivery is quoted at 8.62½c., New York, duty paid, unchanged from last week.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. a lb. with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Dec. 10. — Demand for non-ferrous metals, though scattered and in small lots, is more active than a week ago. Prices for tin and lead are higher while quotations on zinc are lower. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 40.75c.; lead, 6.20c.; zinc, 6c.; in less-than-carload lots, antimony, 9.50c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 22c.; block tin, 32c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Missouri Pacific Places Order For 1285 Freight Cars

THE Chesapeake & Ohio, Hocking Valley and Pere Marquette are reported to be on the verge of putting out an inquiry for about 13,000 freight cars to cover their 1930 requirements. It is believed that these carriers, all of which are controlled by the Van Sweringen interests, will be in the market within the next week or two. The Missouri Pacific has ordered 1285 freight cars and the Shell Petroleum Corporation 100 tank cars. The Reading is asking for bids on 100 multiple-unit electric coaches. The St. Louis Southwestern is inquiring for 25 locomotives, the Chicago Great Western for 10 and the Bessemer & Lake Erie for nine. The Burlington has purchased 20 locomotives. Details of the week's business follow:

Canadian National is inquiring for 20 60-ft. baggage cars.

Reading is taking bids on 100 multiple-unit electric coaches.

Beauharnois Light, Heat & Power Co., Montreal, has ordered 60 air dump cars from National Steel Car Corporation.

St. Louis Southwestern is now inquiring for 25 locomotives instead of 10, as reported last week.

Chicago Great Western is in the market for 10 locomotives.

Bessemer & Lake Erie will purchase nine locomotives.

Shell Petroleum Corporation has purchased 100 tank cars from General American Tank Car Corporation.

Rock Island is in the market for 10 coaches.

Chesapeake & Ohio, Pere Marquette and Hocking Valley railroads are lining up their freight carr requirements and are expected to issue an inquiry shortly for about 13,000 cars.

Missouri Pacific has ordered 625 box cars from Mount Vernon Car Co. and 625 box and 35 caboose cars from American Car & Foundry Co.

Bethlehem Steel Co. has purchased three locomotives from Baldwin Locomotive Works.

Chicago, Burlington & Quincy has awarded 12 Pacific type and eight mountain type locomotives to Baldwin Locomotive Works.

Belt Line Railway, Chicago, has purchased five locomotives from Baldwin Locomotive Works.

American Bridge Co. has bought one locomotive from Baldwin Locomotive Works.

Atchison, Topeka & Santa Fe has placed one locomotive with Baldwin Locomotive Works.

Foremen Organize Club at Racine, Wis.

Ninety foremen in plants at Racine, Wis., have organized a Foreman's Club to promote fellowship, cooperation and the exchange of ideas, largely through organization efforts of J. W. Morley, industrial secretary of the Racine Young Men's Christian Association, who was elected executive secretary of the organization. Other officers include Joseph D. Duffield, Belle City Malleable Iron Co., president; W. J. Walters, Massey-Harris Co., vice-president; and Harold Bullmore, Dumore Electric Co., secretary-treasurer. Among other industries represented are Harvey Spring & Forging Co., Lakeside Malleable Iron Co., J. I. Case Threshing Machine Co. and the Webster Electric Co.

Reinforcing Steel

Awards Total 1600 Tons—New Work Requires 2500 Tons

REINFORCING steel awards the past week totaled 1600 tons, of which 500 tons is for a warehouse at Newark, N. J. About 2500 tons was added to pending business, the largest inquiry being for 1000 tons for a municipal waterworks at Albany, N. Y. Awards follow:

BROOKLYN, 175 tons, *New York Times* plant, to Truscon Steel Co.

NEWARK, N. J., 500 tons, warehouse for Lehigh Warehouse & Transportation Co., to Faitoute Steel Co.

JERSEY CITY, N. J., 360 tons, bridge across Hackensack River, to Kalman Steel Co.

DEAL, N. J., 150 tons, sewage disposal plant, to Kalman Steel Co.

WAUKEGAN, ILL., 250 tons, addition to power plant of Public Service Co. of Northern Illinois, to American System of Reinforcing.

CLEVELAND, 250 tons, Severance Hall, to Bourne-Fuller Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

ALBANY, N. Y., 1000 tons, municipal waterworks.

BROOKLYN, 125 tons, subway route 109, section 3.

PHILADELPHIA, 1500 tons, two slaughter houses to be erected by Pennsylvania Railroad for Vogt Packing Co. and West Philadelphia Packing Co.

CINCINNATI, 265 tons, public school.

CHICAGO, 135 tons, bridge at Ninety-Fifth Street; Materials Service Corporation, general contractor.

CHICAGO, 380 tons, bridge; Underground Construction Co., general contractor.

OTTAWA, ILL., 250 tons, hotel.

Tone of Scrap Market in Detroit Stronger

DETROIT, Dec. 10.—The closing of Lake navigation has depressed prices on heavy melting and shoveling steel and hydraulic compressed scrap 50c. to $1 a ton. Borings and short turnings have advanced the same amount and long turnings are up 50c. a ton. Some releases on current orders during the past week have emphasized the small tonnage that is being produced, and the general tone of the market is stronger despite present quoted prices. Indications are that there will be some considerable buying done by mills and furnaces before the first of the year.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$11.50 to $12.00
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automotive cast	11.50 to 12.00
Hydraul. comp. sheets	11.00 to 11.50
Stove plate	9.00 to 9.50
New No. 1 busheling	10.50 to 11.00
Old No. 1 busheling	9.00 to 9.50
Sheet clippings	8.00 to 8.50
Flashings	9.50 to 10.00

Lake Ore Water Shipments Break Record

Season's Total 65,204,600 Tons Against 64,734,198 in 1916—Aggregate of Rail and Boat Movement Down

SHIPMENTS of Lake Superior ore by water during 1929 ended with the movement of one December cargo of 9112 tons from Marquette. Total shipments by water during 1929 amounted to 65,204,600 tons, breaking the former record of 64,734,198 tons in 1916 by nearly 500,000 tons. The increase was 11,223,726 tons, or 20.7 per cent, over last year.

All-rail shipments this year will be approximately 1,000,000 tons, or only about half as much as during 1916, so that the total water and all-rail movement this year will be about 700,000 tons less than in 1916, when the total movement was 66,902,778 tons.

After several record-breaking months, November shipments took a drop, amounting to 3,941,524 tons, a decrease of 319,419 tons from November last year.

Shipments by boat for November, for the entire year and for 1928 and total water shipments for 10 years are listed herewith.

LAKE ORE SHIPMENTS BY WATER, GROSS TONS

	November	Season 1929	Season 1928
Escanaba	574,520	6,348,573	5,487,556
Marquette	348,887	4,448,388	3,410,902
Ashland	422,081	7,620,060	6,481,158
Superior	1,146,655	19,623,139	15,413,694

1923	59,036,705	1928	53,980,874
1924	42,623,572	1929	65,204,600

Interlake Iron Corporation Formed by Merger

Stockholders of the By-Products Coke Corporation, Chicago, at a special meeting in New York, Dec. 9, ratified the purchase of the properties and assets of the Zenith Furnace Co., Duluth, Minn., and the Toledo Furnace Co., Toledo, Ohio, and of the stock of the Perry Furnace Co., which owns a blast furnace and coke oven plant at Erie, Pa., together with valuable interests in ore mines in the Lake Superior district and coal properties in Green County, Pa.

The name of the company has been changed to the Interlake Iron Corporation, to which the new properties will be transferred Jan. 1. The company will have an annual capacity of over a million tons of pig iron and a half million tons of coke for the domestic market. The ore properties just acquired will satisfy the total requirements of the company's furnaces and will yield satisfactory grades of ore of all kinds produced on the six iron ore ranges of Lake Superior.

Pickands, Mather & Co., Cleveland, as well as the individual members of the firm who own stock in all of the companies in the merger, will take stock in the Interlake Iron Corporation in exchange for their several holdings and will remain prominent in the management of the new company. H. G. Dalton, Pickands, Mather & Co., will be chairman of the board of the Interlake company; C. D. Caldwell, president, By-Products Coke Corporation, will be president; and W. B. Castle, formerly president of the Zenith Furnace Co., and Elton Hoyt, II, Pickands, Mather & Co., vice-presidents. Samuel Mather, Mr. Dalton and Mr. Hoyt will be directors.

No new financing has been necessary in the new arrangement. The balance sheet of the corporation will show current assets in excess of five times the current liabilities. The property and investment account will be in excess of $50,000,000. First mortgage bonds of the By-Products Coke Corporation, approximating $6,600,000, and of the Zenith Furnace Co., approximating $3,000,000, will be assumed by the new corporation, and with bonds totaling $75,000 of the Perry Furnace Co. will be the only funded debt outstanding, all other securities being represented by 2,000,000 shares of no par common stock.

Sharon Steel Hoop to Make Nirosta Products

The Sharon Steel Hoop Co., Sharon, Pa., has concluded negotiations with the Krupp Nirosta Co., Inc., holder of the Krupp patents of Dr. Strauss, under which it will immediately proceed with the production and distribution of high-alloy rust-resisting iron of the KA2 type and other brands. The Sharon company has also made arrangements with the Ludlum Steel Co., Watervliet, N. Y., by which the latter will for the present furnish the alloy ingots or semi-finished steel to the Steel Hoop company, principally from its Dunkirk, N. Y., plant. This will enable the Sharon company to begin distribution of this steel at an early date, probably during January, 1930. All the facilities and metallurgical staffs of both the Ludlum and Sharon companies will be utilized in bringing out the products.

Newton Steel Co. Expects Better Automobile Buying

The Newton Steel Co. has declared the usual quarterly dividends of 75c. a share on common stock and $1.50 on preferred for the fourth quarter. Officials report that steel stocks in possession of automobile companies are at low ebb, and they anticipate substantial improvement in requirements of automobile steels in the first quarter of 1930.

Jobbers to Distribute Falk Flexible Couplings

A new method of distributing Falk flexible couplings has recently been adopted by its manufacturer, the Falk Corporation of Milwaukee. In the future, this product will be handled by leading distributers of mill machinery and electrical supplies located at strategic points throughout the country. In the past, distribution has been limited to company branch houses and special agents in some of the larger cities.

A complete service plan has been formulated which will enable distributers in all centers to carry complete stocks of couplings, quickly available to the trade. It is the plan of the Falk Corporation to select distributers to carry out this plan. After the distributers are appointed, the company will aid them through the cooperation of factory salesmen and by sales helps of various kinds.

Stanley Electric Tool Co. a Merger of Several Lines

The Stanley Works, New Britain, Conn., announces the formation of the Stanley Electric Tool Co. This new company will manufacture and distribute the electrically-operated hand tools developed by the Stanley Rule & Level Co., including electric drills, screw drivers, bench and aerial grinders, etc.

The recent purchase of The Unishear Co., New York, adds to this list of products a complete line of motor-powered shears for outside and inside cutting of sheet metal. Another company recently acquired is the Ajax Electric Hammer Corporation, New York, which has for some time manufactured and sold Ajax electric hammers and bits.

A contract has been placed by the Jones & Laughlin Steel Corporation with Arthur G. McKee & Co., Cleveland, for a patented revolving distributor of the latest roller bearing type for No. 3 blast furnace at the Aliquippa plant. The same supplier is to furnish also eight 6-ft. Kling goggle valves for the same plant.

PERSONAL

L. C. REIS, vice-president and general superintendent, Minnesota Steel Co., Duluth, Minn., has been made president to succeed the late S. B. SHELDON.

—

C. H. HERTY, JR., supervising metallurgist, United States Bureau of Mines Experimental Station, Pittsburgh, addressed the Canton-Massillon chapter of the American Society for Steel Treating, Dec. 9. His topic was the deoxidation of steel.

—

IRVING LANGMUIR, president of the American Chemical Society and associate director of the research laboratory of the General Electric Co., will receive the Chandler medal for "distinction in chemistry" on Dec. 13, when he delivers the Chandler lecture at Columbia University, New York, on "Electrochemical Interactions of Tungsten, Thorium, Caesium and Oxygen."

—

CHARLES M. NUCKOLLS, formerly with the International Harvester Co., Chicago, has been placed in charge of design and development work in the crane department of H. D. Conkey & Co., Mendota, Ill.

—

PHILIP BROWN, who has been with the Wilkoff Co., Youngstown, iron and steel dealer, for the past 15 years, has been elected vice-president of the company and general manager of the mill and warehouse division.

—

ARTHUR W. F. GREEN has accepted a position as manager of the tool steel division of the Edgecomb Steel Co., Philadelphia. He will handle particularly the products of the Vanadium Alloy Steel Co., which is one of the companies for which the Edgecomb company is a distributing agent. Mr. Green resigned as sales metallurgist of the Poldi Steel Corporation of America on Nov. 30 to take up his new position. He is secretary-treasurer of the Philadelphia chapter of the American Society for Steel Treating, of which he has twice been chairman.

—

ELTON HOYT, II, Pickands, Mather & Co., Cleveland, has been elected a director of the Newton Steel Co., Youngstown, succeeding G. T. Fillius.

—

PHILIP D. BLOCK, president, Inland Steel Co., has been made a member of the transportation committee of the Chicago Association of Commerce.

—

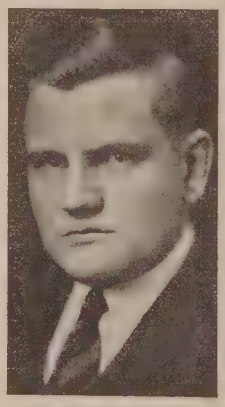
JORDAN KORP, metallurgical engineer with the Leeds & Northrup Co., Philadelphia, will address the St. Louis chapter of the American Society for Steel Treating at a meeting to be held in the American Annex Hotel, St. Louis, Dec. 20, on "Correct Procedure in Heat Treating."

—

WILLIS S. GEORGE has been elected chairman of the board of the Pettibone-Mulliken Co., Chicago. R. E. WILSEY and BEN LYONS were added to the board, which has been increased from seven to nine members. Mr. George will take an active part in the management of the company.

—

FRANK M. HESSE, who has been with the Weirton Steel Co., Weirton, W. Va., since 1912, has been appointed



F. M. HESSE

secretary and treasurer of the National Steel Corporation, which is the company formed by the merger of the Weirton Steel Co., Great Lakes Steel Corporation and the blast furnace subsidiaries of the M. A. Hanna Co. Mr. Hesse was born in New Cumberland, W. Va., and was educated in the public schools of Pittsburgh and at Bethany College.

—

WILLIAM J. CRONIN, secretary of the Tri-City Manufacturers' Association, and A. R. PIERCE, director of industrial education of the National Metal Trades' Association, Chicago, were the speakers at the first meeting of the year of the Industrial Relations Group of the Tri-City Manufacturers' Association, held Dec. 2 at the LeClaire Hotel, Moline, Ill.

—

R. C. TODD, assistant sales manager of the American Rolling Mill Co., Middleton, Ohio, delivered an illustrated lecture on new steel processes, Dec. 10, at a dinner meeting of the Milwaukee Association of Purchasing Agents.

—

W. H. POTTER has been made general sales manager of the Manganese Steel Forge Co., Philadelphia. Formerly, he was manager of the company's Chicago office.

R. B. TUHEY has been appointed district representative at Indianapolis, Ind., by the Lincoln Electric Co., Cleveland, and S. H. TAYLOR has been promoted to a similar position at Los Angeles.

—

WILLIAM K. FARRELL has become general purchasing agent of the American Locomotive Co., New York.

—

GORDON GORDON, who has been secretary of the Taft-Peirce Mfg Co., Woonsocket, R. I., for the past 25 years, has been elected president and treasurer, succeeding the late Louis V. Hubbard. FREDERICK S. BLACKALL, JR., who continues as vice-president and general manager, has been made secretary also.

—

FRANCIS R. WADLEIGH, consulting mining and fuels engineer, New York, and ERNEST L. BAILEY, mining engineer, have become associated as Wadleigh & Bailey, 1 Broadway, New York, to engage in consulting work.

—

W. H. VAN VLECK has resigned as New York district sales manager of the Alan Wood Steel Co.

Duriron Co. Enlarges Plant Manufacturing Facilities

The Duriron Co., Inc., New York and Dayton, Ohio, has under way a plant expansion program calling for an enlargement of its facilities at Dayton and for a foundry at Newark, N. J. The company's foundries have put into operation new electric furnaces of both high-frequency and arc types capable of handling castings up to 10,000 lb. Castings will be manufactured not only in Duriron, Durimet, KA-2 and other alloy steels, but also in monel metal or nickel as corrosion-resistant needs dictate.

The Dayton machine shop has been enlarged to enable the finishing department to keep pace with the increased foundry capacity. The company's line of pumps, valves, pipe, fittings and other standard products will be available in the near future in Durimet or KA-2 alloy steel as well as in Duriron. A new fireproof laboratory is nearing completion at Dayton.

In both sales engineering and manufacturing the company has become affiliated with Industrial Welded Alloys, Inc., both organizations being divisions of Industrial Alloy Products Corporation. This makes it possible for the one unit to furnish practically all requirements for heat and corrosion-resistant materials, including fabricated sheet and plate construction, welded pipe, tanks, towers and special equipment.

What is said to be the largest single order for valves of such large size is one for nineteen 6-ft. Kling goggle valves for the Johnstown plant of the Bethlehem Steel Co. This order was placed with Arthur G. McKee & Co., Cleveland.

OBITUARY

CHARLES E. HILL, assistant general sales agent for the Crucible Steel Co. of America, with headquarters in Pittsburgh, died suddenly at his home in that city on Dec. 1. He was born in North Side, Pittsburgh, in 1883, and after attending school there, he entered the employ of the Crucible company in a secretarial capacity in 1901. He had been with the company continuously since that time, principally in the sales department; in the position he held at the time of his death he was active in the greater part of the middle section of the country.

—

JOHN F. GOLDING, inventor of expanded metal and of machinery for producing it, died at his home in Philadelphia, Nov. 29. He was born in Pittsburgh on May 2, 1848, and was educated in Iowa State University. He had a varied career, having been a farmer, lawyer and editor of the *Industrial World and Iron Worker*, Chicago, before becoming known as an inventor. In 1898 he was awarded the John Scott medal for his invention of expanded metal and machinery for its production. He adapted expanded metal to the reinforcement of concrete. At the time of his death he was vice-president of the United States Nut & Washer Co.

—

WALTER FRANK, service manager of the bar department of the Interstate Iron & Steel Co., died Dec. 5, aged 35 years. His first employment by a steel company was in the Chicago office of the Republic Iron & Steel Co., from which he was transferred to a position at the Moline, Ill., mills. Several years later he returned to Chicago to accept a position with the Interstate company, where he advanced by successive steps to the position which he held at the time of his death.

—

HENRY ADAMS, for some years head of the mechanical engineering department of the office of the Supervising Architect of the Treasury Department, Washington, and for the past 30 years consulting engineer with offices in Baltimore, died suddenly Dec. 9 at his home in Baltimore. He was born in 1858 at Duisburg, Germany. He was one of the early presidents of the American Society of Heating and Ventilating Engineers.

—

MAURICE A. OUDIN, vice-president of the International General Electric Co., died at his home in Schenectady Dec. 4, following an illness with pneumonia, aged 63 years. He was graduated from the College of the City of New York in 1885 and was graduated from Princeton University in 1891. He joined the Thomson-Houston Electric Co., Lynn, Mass., and continued in various capacities with its successor, the General Electric Co., at Schenectady. He was made manager of the foreign department in 1904, and traveled extensively in Russia, China, and Japan. When the International General Electric Co. was formed in 1919 Mr. Oudin was appointed its first vice-president. He served on the Advisory Committee of the Far East, a group of business men with which the Department of Commerce conferred on major problems relating to the Far East while President Hoover was Secretary of Commerce.

CHARLES E. HILL

J. F. GOLDING

—

FREDERICK A. COE, formerly with Morris, Wheeler & Co., Philadelphia, died at his home in Philadelphia, Dec. 5, aged 92 years. He was born in England and entered the employ of Morris, Wheeler & Co. in 1888, with whom he remained until his retirement 20 years ago.

—

SAMUEL T. WEYMAN, one of the founders of the Atlantic Steel Co., Atlanta, Ga., and for many years a vice-president of the Connors-Weyman Steel Co., Birmingham, was killed in a fall on his estate, in fighting a forest fire Nov. 28. He was 67 years old.

—

FORRESTER B. LESLIE, sales manager of A. C. Leslie & Co., Ltd., iron and steel, Montreal, died on Nov. 21, aged 51 years. He was a son of Alexander C. Leslie, founder of the company, and entered the business when about 21 years of age.

—

JOHN C. TAGGART, assistant general superintendent at the New Castle, Pa., works, Carnegie Steel Co., died on Dec. 4 at a hospital in that city. He was 66 years of age.

—

DAVID C. KLAUSMEYER, assistant to the president, Cincinnati Bickford Tool Co., died suddenly in Cincinnati, Dec. 6. He was born in New York, Oct. 31, 1882. He was graduated from the Ohio Mechanics Institute and started work in the shops of the Bickford Drill & Tool Co., one of the constituent companies merged into the Cincinnati Bickford Tool Co. Eventually, Mr. Klausmeyer was put in charge of all designing and later of production.

Canadian Iron and Steel Made in 1928

Output valued at $609,632,999 is reported by the Dominion Bureau of Statistics, Ottawa, for iron and steel plants in Canada and plants working up iron and steel into finished form. There were 1159 establishments, with capital figured at $702,931,186, covered in the survey. These plants employed 119,200 people and paid salaries and wages aggregating $168,320,039. Deducting cost of materials from selling value of products, the estimated value added by manufacture was $300,014,925.

Imports into Canada of iron and steel and other products in 1928 were valued at $322,979,144, of which more than 91 per cent, or $295,114,281, were from the United States. The total shows a gain of about $75,000,000 over 1927. Exports in 1928 were $70,665,677, or a gain of about 4 per cent on 1927. The United States received more than any other country, with $9,216,896. United Kingdom, Australia, Argentina, India, New Zealand, Brazil and British South Africa followed, in that order, all with amounts of more than $2,950,000.

Among the principal producing industries automobiles stood first, with $162,067,495 of products. Castings and forgings showed $81,904,852. Railroad rolling stock was third, with $73,422,057; primary iron and steel, $62,071,694; machinery, $51,046,139; sheet metal products, $49,846,671; agricultural implements, $41,199,841; hardware and tools, $25,131,821, and other products in smaller amounts.

Steel Cartels Disorganize Market

Uncertainty Rules Both Buyers and Sellers—Dutch Make More Pig Iron—Zinc Sheet Cartel Proposed—Holidays Slow British Trade

(*By Cable*)

LONDON, ENGLAND, Dec. 9.

WITH the holidays approaching and annual inventories being made, the iron and steel markets are quiet. Cleveland pig iron makers are well sold to the end of the year, and stocks are low, so that price concessions have been refused. Export business is unobtainable at present high prices.

Hematite furnaces have sold iron at £4 ($19.52) a ton for prompt shipment and £4 1s. ($19.76) a ton for forward delivery of mixed numbers, but are still making deliveries on a number of uncompleted large contracts at low prices.

General export sales of heavy steel are slow, but mill order books are fairly well filled with domestic contracts.

Tin plate is firm with demand active and mills well sold ahead. World consumption is reported increasing and the outlook is considered favorable. Severe floods in Wales have affected some mills and materially reduced output.

The British Can Co., with a capital of £750,000 ($3,660,000) has been formed to enter into food packing and allied activities in the United Kingdom, in conjunction with the American Can Co., which will supply can making equipment, and the Thermokept Corporation, which holds licenses for food packing patents. The nucleus of the new corporation was provided by the purchase of the can business of Ernest Taylor, Ltd., Liverpool.

Galvanized sheets are quiet and prices are easy, with works unable to obtain specifications. Black sheets are quiet after the recent moderate activity in Japan on light gages. Germany is selling No. 30 gage sheets to Japan for £12 3s. ($59.29) a ton, or 2.69c. a lb., f.o.b.

British steel makers are arranging a London sales office under the management of Julian Piggott, which will be known as the British Steel Makers Export Association.

The Continental market is somewhat disorganized by the International Steel Cartel meetings. Reported decisions of the cartel are uncertain, but are believed to mean confirmation of the 10 per cent reduction of output originally suggested in November, but so far adopted only by Belgium.

It is understood that this reduction has been applied to all members from the beginning of December and that a minimum price on merchant bars of £5 5s. per ton (1.14c. per lb.) has been confirmed. At a future meeting in Charleroi, Belgium, two representatives each from Germany, France, Luxemburg and Belgium will arrange a list of international extras and fix minimum prices on other products. A preliminary price of £5 per ton (1.09c. per lb.), f.o.b., is reported to have been established on beams. The International Steel Cartel is meeting Dec. 14 at Dusseldorf, and renewal of the agreement is confidently expected.

The European Wire Rod Cartel has been renewed for another 12 months, provided the German syndicate is also prolonged. The International Rail Makers Association is meeting in Dusseldorf, Dec. 13, and the Continental Tube Cartel, Dec. 10.

Meanwhile, the general market is uncertain, with both buyers and sellers reluctant to transact business.

British Pig Iron Less Active

Consumers Reluctant to Pay Present Prices—Coke Supply Improves—Tin Plate Mills Well Booked

LONDON, ENGLAND, Nov. 25.—The tone of the iron and steel markets has improved slightly, but the volume of new business is small. The usual seasonal activity in pig iron has been less pronounced, consumers being reluctant to follow the upward trend of prices. For some time the fuel situation has been acute and prices have been advancing, but during the

*Open-hearth steel, 8s. ($1.94) per ton extra.

past fortnight Cleveland producers have blown out two furnaces for repairs and, as a result, pressure for fuel has relaxed and prices have eased slightly. Makers point out, however, that selling prices of pig iron have been less than cost of production for some time and have made no revision in their quotations.

Furnaces are, as a rule, fairly well engaged for the next few weeks and some sizable contracts have been made for deliveries of iron in the first quarter. Current output of Cleveland iron is being fully absorbed and stocks on yards are negligible. Hematite producers are fairly well occupied at present and some substantial sales to domestic and export buyers have enabled them to advance prices to a more profitable level. For first quarter delivery, hematite iron is being quoted at £4 1s. ($19.76) per ton for East Coast, mixed numbers, an advance of about 4s. (98c.) per ton within a few weeks.

Recently, Continental ship owners placed an order for seven large oil tank ships, which are to be entirely built of British steel. Conditions in the finished steel market have not been active, although domestic mills are supplying the bulk of the heavy steel requirements and there is considerable activity in general engineering and construction.

The announcement of the International Steel Cartel that output was to be reduced by 10 per cent was expected by British mills to diminish the recent severe competition in foreign markets. Although Continental prices did develop some firmness immediately after the announcement, this improvement has not been maintained and European mills are still offering severe competition for export orders.

World demand for tin plate is reported good and is expanding steadily. Unfilled orders on makers' books early this month were the largest in a number of years and included a contract for oil can tin plate. Many mills are booked with business well into next year. Restriction of output has worked satisfactorily and even at today's prices it pays some mills better to receive 2s. (49c.) per base box for underproduction. Makers claim that the present base price of 18s. 9d. ($4.58) per base box, f.o.b. port, is not especially profitable and that any substantial advance in the tin market will undoubtedly be promptly reflected in the tin plate quotation.

German Shipyards Building American Ships

HAMBURG, GERMANY, Nov. 27.—German shipyards have recently booked some sizable shipbuilding contracts from the United States. The Bremer Vulcan shipyard has been awarded a 16,000-ton merchant ship driven by MAN Diesel engines. The Germania Werft, Kiel, controlled by the Krupp interests, has booked a 17,000-ton tank ship, equipped with Krupp Diesel engines, and the Vereinigte Nordsee Werften, a 15,000-ton tank ship with Sulzer Diesel engines from the Standard Oil Shipping Co., New York.

Other shipbuilding contracts from the United States have included a 2500-ton private yacht to be built by the Germania Werft, Kiel, which brings the total of private yachts built by this yard for American owners, since 1925, to seven. The Germania Werft is also building two merchant ships of 8000 tons each for American companies.

German Aluminum-Coated Sheet Mill Completed

HAMBURG, GERMANY, Nov. 27.—The Stahlwerk Hoesch announces that its new mill at Stockheide for the production of aluminum-coated steel sheets has been completed and trial operation of the new equipment gave satisfactory results. Regular commercial production of aluminum-coated sheets will begin in December or early in January.

European Zinc Sheet Cartel Proposed

HAMBURG, GERMANY, Nov. 27.—The recent dissolution of the Continental Zinc Cartel has occasioned no surprise, as the cartel had for some time been unable to control its membership. Although it regularly fixed a production quota based on the output of zinc in November, 1928, members were not influenced by the cartel decisions, although they voted for them, and for some time production of zinc in Germany, Belgium and Poland had increased whenever the cartel announced restriction of output.

It is expected that the European zinc sheet producers will form a cartel. Meanwhile, the German Zinc Sheet Cartel has taken over export sales of about 75 per cent of the zinc sheet production of Germany and all the production of Austria, Poland, Hungary and Czechoslovakia. This gives it about 105,000 tons of zinc sheets annually to sell for export. Belgian producers, which exported about 56,000 tons last year, are reported negotiating with the German cartel.

Dutch Pig Iron Output Increased Last Year

HAMBURG, GERMANY, Nov. 27.—Pig iron production of the Royal Netherlands Blast Furnace & Steel Works, Ymuiden, Holland, in the fiscal year, July 1, 1928, to June 30, 1929, was 256,479 tons, compared with 209,875 tons in fiscal year 1927 to 1928. A total of 215,714 tons was shipped for export in 1928-1929, compared with 149,633 tons in the previous year, the greater part of the tonnage going to Great Britain and the United States. Completion of a third blast furnace early next year will bring the total capacity of the company to 400,000 tons a year.

Nirosta Licenses Granted 24 German Makers

HAMBURG, GERMANY, Nov. 27.—Although the Friedrich Krupp A. G. is the sole German holder of patents on high-chromium nickel steel, the company is not seeking to monopolize the production of this alloy, and to date has licensed 24 makers in Germany to operate under the patents for Nirosta. The charge for licenses is not high, but the number of licensed makers makes a substantial total income from this source. A policy of licensing other makers was adopted by the Friedrich Krupp A. G. as the best means of avoiding possible severe competition from companies that otherwise might have developed a competitive product to which the patents might not have applied.

European Wire and Nail Prices Shaded

HAMBURG, GERMANY, Nov. 27.—The German Wire Makers' Cartel has fixed its prices at £7 12s. 6d. per ton ($1.66 per 100 lb. keg) for wire nails, £7 7s. 6d. per ton (1.61c. per lb.) for bright wire, £12 7s. 6d. per ton (2.69c. per lb.) for barbed wire, and £9 per ton (1.96c. per lb.) for galvanized wire. Belgian wire mills are shading these prices by as much as 10s. ($2.44) per ton, which has resulted in similar large concessions being offered by the German makers.

Restriction of Cartel Output Disregarded

HAMBURG, GERMANY, Nov. 27.—Although the International Steel Cartel has officially reduced the steel production quota by 10 per cent, restriction of output began to be disregarded as soon as prices registered a slight upward turn. Consequently most mills are maintaining their former rate of operation and may pay a slight penalty for excess output. As the disregard of the restriction announced by the cartel is believed to be general with all members, and in the case of general overproduction the penalty payments are refunded in proportion to the excess of output, most makers will probably lose little.

German mills, which have been urging a selling syndicate for products of members of the International Steel Cartel, are pointing to the present inability of the cartel to control prices or production as further proof of the necessity for such a sales organization, which will be discussed at a meeting of a special committee of the cartel at Liége, Belgium, Dec. 3.

The Hevi-Duty Electric Co. has moved into larger quarters at 4100 Highland Boulevard, Milwaukee. The new building will provide double the present productive capacity and is especially equipped for building furnaces and furnace equipment.

Machinery Markets and News of the Works

Tool Sales Holding Up Well

Despite Proximity of Holidays and Inventory, Sales Have Gained

IN view of the slackening pace of business throughout the country, machine tool sales have been holding up unusually well. Despite the proximity of the holiday season and the annual inventory period, the volume of orders has actually shown a gain over the preceding two weeks.

While bookings are considerably less than they were a few months ago, in most centers they are paralleling those of November and are ahead of the record reported for the corresponding month of last year.

The amount of pending business, as well as numerous inquiries which are expected to be put out soon, gives promise of an active market for machine tools in the early weeks of 1930.

There has been no appreciable diminution in tool builders' shop schedules, which are being maintained practically at full capacity.

The Amtorg Trading Corporation, New York, has placed an order with a Cincinnati builder for 10 standard lathes. A New York district user has purchased three large lathes.

Foremost among lists which will appear shortly is one for $250,000 worth of machine tools for the Illinois Steel Co. The Allis-Chalmers Mfg. Co., Milwaukee, also may buy a large amount of equipment for its tractor plant additions at Milwaukee and Springfield, Ill.

Some automobile parts manufacturers are busier, having received large orders from the Ford company, and are buying a few tools. A machine tool user is asking for prices on seven turret lathes which he will buy in the immediate future. The Electric Auto-Lite Co., Toledo, is contracting for tools to equip its new plant extensions.

New York

NEW YORK, Dec. 10.—While demand for machine tools is smaller than two months ago, it is holding up much better than is usual at this time of the year. November sales, though below those of October, were higher than the total for the same month last year. A favorable indication is that the volume of inquiries has increased within the past week or two. Considerable of this prospective buying probably will go over into January. An unusual sale of the past week was a $20,000 grinding machine to a Boston company.

Brooklyn Borough Gas Co., 1721 Sheepshead Bay Road, Brooklyn, has plans for equipment storage and distributing plant, with mechanical shop, and automobile service, repair and garage building at 805-33 Neptune Avenue, to cost $275,000 with equipment. Bloch & Hesse, 18 East Forty-first Street, New York, are architects; C. E. Smith, 116 West Thirty-ninth Street, New York, is engineer.

Fein Tin Can Co., Inc., 65 Greene Street, New York, has leased space in building of New York Dock Co., Furman Street, Brooklyn, for manufacture of tin and other metal containers, steel pails, etc., to cost more than $70,000.

Westchester Lighting Co., 9 South First Avenue, Mount Vernon, N. Y., is arranging expansion and improvement program, including addition generating and transmission facilities, to cost $8,000,000.

M. J. Ort, 424 East 149th Street, New York, architect, has plans for a six-story automobile service, repair and garage building, to cost $185,000 with equipment.

Grover Loening, formerly consulting engineer and director of Keystone Aircraft Corporation, Bristol, Pa., has organized Grover Loening Co., with capital of $1,000,000, to operate plant for experimental airplane work and development, including production of single-motor aircraft. Space was recently secured at 305 East Forty-sixth Street, and operations will be placed under way at once.

Parkway Motor Co., Orawaupum Street, White Plains, N. Y., will soon begin superstructure for two-story service, repair and garage building, to cost about $100,000 with equipment. P. B. Nichols, Depot Plaza, is architect.

Rubel Coal & Ice Corporation, 937 Fulton Street, Brooklyn, has plans for three-story ice-manufacturing plant, refrigerating and ice cream factory to cost about $400,000 with machinery. Henry J. Nurick, 44 Court Street, is architect and engineer.

Spoor-Lasher Co., Inc., Poughkeepsie, N. Y., general contractor, has acquired local plant of Phoenix Horseshoe Works for about $250,000, and will remodel for equipment storage, distributing and repair plant for company service.

Sonora Products Corporation, 50 West Fifty-seventh Street, New York, manufacturer of talking machines and parts, has perfected new machine for reproducing talking motion pictures in home, and will develop plant capacity for new units.

Union Free School District No. 2, Tuckahoe, N. Y., is considering installation of manual training equipment in new two- and three-story high school to cost about $550,000, for which bids are being received on general contract. Knappe & Morris, 171 Madison Avenue, New York, are architects.

G. G. Miller, 1482 Broadway, New York, architect, has filed plans for multi-story automobile service, repair and garage building, to cost about $200,000 with equipment.

Idealite Lamp Shade Mfg Co., 836-38 Broadway, New York, manufacturer of metal frame lamp shades, metal novelties, etc., has leased four-story factory at 49-55 Fremont Street, Jersey City, N. J., for new plant. Three existing plants in New York and one factory at Higganum, Conn., will be removed to new location where production will be concentrated.

Department of Public Affairs, City Hall, Newark, Jerome T. Congleton, director, will receive bids until Dec. 19, for storage batteries, manhole frames and covers, couplings, drive chains and fan belts, etc.

Kent Garage Investing Corporation, 350 Madison Avenue, New York, will soon begin superstructure for multi-story service, repair and garage building, 180 x 190 ft., at Newark, to cost over $1,000,000 with equipment. Fougner & Gautier, 103 Park Avenue, New York, are architects.

William Prym of America, Inc., 16 West Nineteenth Street, New York, manufacturer of metal products, is considering new plant at High Bridge, N. J., to cost over $100,000 with equipment.

Montauk Equipment Co., Hoboken, N. J., has leased space in building at 1021 Grand Street, totaling 7500 sq. ft. floor space, to manufacture electrical specialties.

Public Service Railway Co., Public Service Terminal, Newark, is contemplating two-story automobile service, repair and garage building, 100 x 370 ft., for motor buses, to cost about $135,000 with equipment.

Beckwith-Chandler Co., Wright Street and Avenue B, Newark, manufacturer of colors, varnishes, lacquers, etc., has revised plans for three-story addition, to cost about $100,000 with equipment. Abbott, Merkt & Co., 175 Fifth Avenue, New York, are architects.

Lydon Brothers, Inc., recently organized, is manufacturing industrial ovens

for japanning, enameling, core baking, tempering, annealing and glass decorating, at its plant, 229 Colden Street, Jersey City. T. Lydon, formerly district sales manager of Young Brothers, Detroit, heads the company.

Philadelphia

PHILADELPHIA, Dec. 9.—Standard Oil Co. of Pennsylvania, Inc., Sixth and Chestnut Streets, Philadelphia, will take bids at once for new refinery, storage and distributing plant on Schuykill Avenue, to cost over $175,000 with equipment.

Reading Co., Reading Terminal, Philadelphia, has plan for expansion to cost $10,000,000, part of fund to be used for electrification program, now under way from Philadelphia to Lansdale, and for completion of car repair, storage and equipment shops at Wayne Junction, last-noted to cost about $1,000,000 with equipment. Engineering department of railroad is in charge.

Ovens, power equipment, conveying and other machinery will be installed in six-story and basement addition, 60 x 120 ft., to be erected by Tasty Baking Co., 2801 Huntington Park Avenue, Philadelphia, to cost more than $350,000 with equipment, for which contract has been let to Turner Construction Co., Seventeenth and Walnut Streets.

Bachmann Brothers, 609 Commerce Street, Philadelphia, manufacturers of celluloid and kindred products, have asked bids on general contract for two-story factory, to cost over $70,000 with presses and other equipment. Eugene A. Stopper, Fuller Building, is architect.

A. Moe & Co., Inc., Philadelphia, has been organized by Lewis H. Christensen, 5651 North Mascher Street, and associates, to take over and expand A. Moe & Co., operating a general machine works at 122 Lombard Street. New organization will engage as iron and brass founder, in addition to machinist, and will also operate a welding works.

Farman Aircraft Corporation of France, affiliated with Ludington Aircraft, Inc., Island Road and Tinicum Avenue, Philadelphia, N. Ludington, president, has plans by Airport Development & Construction Co., Mitten Building, for three-story aircraft manufacturing plant near Camden, N. J., to cost over $100,000 with equipment.

Armstrong Cork Co., Camden, N. J., with headquarters at Lancaster, Pa., has awarded general contract to Townsend, Schroeder & Wood, Inc., Philadelphia, for four-story and basement addition, to cost more than $100,000 with equipment. Part of unit will be used for oven department.

Sun Oil Co., 1608 Walnut Street, Philadelphia, is said to be arranging for expansion at refinery and storage and distributing plants at Linwood, Pa., in connection with a pipe line project from Linwood and Marcus Hook plants to different points in Pennsylvania and extending to New York State line. Entire project will cost over $2,500,000, with booster pumping plants and operating facilities. It is understood that a subsidiary company will be formed to carry out pipe line project.

Lansdowne Heating Co., Lansdowne, Pa., J. M. Delton, Drexel Hill Lumber & Supply Co., head, is considering early construction of steam power plant for central heating service, to cost more than $80,000 with equipment. A site has been secured.

Byron-Jackson Co., Berkeley, Cal., manufacturer of pumping machinery, oil well equipment, etc., has secured property near Saucon Park, Bethlehem, Pa., for establishment of branch plant, to cost over $85,000 with equipment.

Lycoming Mfg. Co., Williamsport, Pa., manufacturer of automobile engines, a subsidiary of Auburn Automobile Co., Auburn, Ind., is pushing work on an expansion program, including additions to foundry and assembling plants. A new machine shop is scheduled for completion early next year, to be given over to production of a new type of radial aircraft engine. Entire program will represent investment of more than $250,000. W. H. Beal is vice-president, in charge.

Barbour Brothers Steel Co., Trenton, N. J., has been organized with capital of $100,000 and 1500 shares of stock, no par value, to take over and expand iron and steel works of Barbour Brothers, Marion Street and Reading Railway. New company is headed by David and William B. Barbour, and William B. Barbour, II.

The Crane Market

NEW inquiry for locomotive cranes has declined as the year end approaches, and with contractors completing their contracts many rented cranes are being returned to the owners. The Bethlehem Steel Co., Bethlehem, Pa., has closed on a 50-ton locomotive crane, for which it has been in the market for a month. The overhead crane market is also inactive and not much improvement is expected by some sellers until after the first of the year, except for the probable award of certain business, which has been under consideration for some time. The Boston & Maine Railroad is reported considering an inquiry for an overhead crane and the Boston & Albany Railroad has closed on a gantry crane.

In the Pittsburgh district, inquiries for overhead cranes have declined in the past few weeks and most of the installations under consideration are expected to be delayed until after the first of the year. The Carnegie Steel Co. is negotiating for a number of cranes for various plants.

Among recent purchases are:

Boston & Albany Railroad, Boston, 20-ton, 58-ft. span gantry crane with 5-ton auxiliary from Milwaukee Electric Crane & Mfg. Corporation.

Standard Oil Co. of New York, 3-ton, 64-ft. 9-in. span hand power crane for export from unnamed builder.

Illinois Steel Co., Gary, Ind., two 30-ton, 8-wheel, steam-driven locomotive cranes from Orton Crane & Shovel Co.

Steel Products Co., McKees Rocks, Pa., 3-ton, 47-ft. span, electric overhead crane from Northern Engineering Works.

Center Foundry & Machine Co., Wheeling, W. Va., 20-ton and 10-ton, 50-ft. span electric overhead cranes from Northern Engineering Works.

Buffalo

BUFFALO, Dec. 9 — Plans have been filed by Buffalo Sintering Corporation, 10 Marilla Street, Buffalo, for one-story plant, to cost about $80,000 with equipment.

Coplan Steel Co., Hull, Que., is arranging for resumption of operations at plant at Ogdensburg, N. Y., which suspended production about three years ago. Initial work will be given over to finishing operations only, locomotive grates and other rough castings being shipped from Hull plant for that purpose. A. H. Coplan is head.

National Paper Products Co., Carthage, N. Y., a division of Crown Zellerbach Corporation, San Francisco, has work under way on extensions and improvements in former local mill of West End Paper Co., recently acquired, including installation of additional equipment, to cost over $100,000.

William and Samuel Bazarnic, 1076 College Avenue, Elmira, N. Y., have organized William Barzarnic, Inc., with capital of 1000 shares of stock, no par value, and plan operation of machine shop and mechanical works for production of iron and steel specialties.

New York & Ontario Power Co., care of George S. Van Kennen, Ogdensburg, N. Y., is considering construction of hydroelectric generating plant near Waddington, N. Y., to cost about $450,000, including transmission system.

Savage Arms Co., Utica, N. Y., has purchased shotgun and rifle manufacturing division of A. H. Fox Gun Co., Eighteenth Street and Wagner Avenue, Philadelphia, and will consolidate. Certain equipment will be removed from Fox plant at Utica, where expansion will be carried out to manufacture Fox type of guns as regular line of Savage company. Fox company will continue to operate Philadelphia plant under names of Fox Mfg. Co., and Fox Automotive Products Co., specializing in manufacture of toy pistols and automobile equipment. C. A. Godschalk will continue as president of Fox organization, and J. H. Connelly, secretary and treasurer.

New England

BOSTON, Dec. 9.—Heil Co., 140 Brookline Street, Boston, manufacturer of steel dump bodies for motor trucks, truck hoists, etc., with main plant at Milwaukee, has awarded general contract to John MacDonald Construction Co., 100 Arlington Street, for one-story factory branch and distributing plant at Brighton, Mass., 42 x 190 ft., to cost about $40,000 with equipment.

J. L. White Co., 16 Brown Street, Waterbury, Conn., has awarded general contract to James Corideo, Inc., 76 Eastern Avenue, for one-story welding plant, 60 x 130 ft., to cost about $25,000.

Hemphill Co., Central Falls, Pawtucket, R. I., manufacturer of knitting machinery and parts, has work under way on additional story on two-story factory, 80 x 300 ft., for which general contract recently was let to Rowley Construction Co., 206 Central Avenue, to cost more than $40,000.

American Bosch Magneto Corporation, Springfield, Mass., manufacturer of magnetos, radio equipment, etc., is considering one and two-story addition, for heat-treating and scrap reclamation departments, to cost about $50,000 with equipment.

Greenfield Electric Light & Power Co., Greenfield, Mass., is erecting a three-story and basement equipment storage and distributing plant, 25 x 85 ft., with mechanical and electrical repair departments, to cost over $50,000 with equipment.

Boston & Maine Railroad Co., Cambridge, Mass., is arranging a fund of more than $100,000 for tools and equip-

ment for new engine house and shops now under way at Somerville, Mass.

Chapman Valve Mfg. Co., Indian Orchard, Mass., manufacturer of heavy gate valves, etc., is planning one-story addition to steel foundry, 75 x 150 ft., to cost over $80,000 with equipment. An annealing oven department will be installed.

New Haven Road Construction Co., Inc., Hamden, Conn., has awarded contract for a one-story equipment and utility plant.

Andrew S. Aharonian, Providence, manufacturing jeweler, will soon start work on a two-story, plant, 65 x 82 ft. Grinding and polishing tools will be bought.

Great Northern Paper Co., East Millinocket, Me., has plans for a power house near Matawamkeag, Me.

Multibestos Co., Walpole, Mass., closed bids Dec. 9 on a drying oven unit to cost $10,000 without equipment. Electrical heating and other equipment will be purchased.

J. L. White Welding Co., Waterbury, Conn., has started work on a one-story, 60 x 129 ft., welding shop, to cost $20,000 without equipment.

Mays Mfg. Co., Inc., Providence, metal specialties, will start work at once on a one-story plant, 60 x 84 ft. Some machine tools will be purchased.

Maine Seaboard Paper Co., Augusta, Me., has started work on a $6,000,000 newsprint plant at Bucksport, Me. Special grinding equipment will be purchased.

Detroit

DETROIT, Dec. 9.—Plans are being considered by Kuhlman Electric Co., Twenty-sixth and Jefferson Streets, Bay City, manufacturer of electric transformers and kindred equipment, for one-story addition, to cost about $50,000 with machinery.

Hastings Mfg. Co., Hastings, Mich., manufacturer of piston rings and other automotive equipment, has approved immediate erection of one-story addition, 65 x 320 ft., to cost about $70,000 with equipment. Part of unit will be used for inspection and distributing service.

Motor Wheel Corporation, South Saginaw Street, Lansing, Mich., manufacturer of steel wheels, etc., has plans for two-story addition, 80 x 475 ft., to cost about $175,000 with equipment.

H. S. Lee Foundry Co., Plymouth, Mich., has acquired manufacturing rights for power spraying equipment of Pontiac Tractor Co., Pontiac, heretofore produced under trade name Universal, and will carry out production at Plymouth plant, continuing manufacture of gray iron and semi-steel castings.

City Council, Allegan, has plans for a municipal hydroelectric power plant, to cost more than $400,000 with transmission system, and will begin work soon. Ayres, Lewis, Morris & May, Cornwall Building, Ann Arbor, are architects and engineers.

American Twist Drill & Tool Co., 2804 West Jefferson Street, Detroit, has plans for one-story addition, to cost more than $75,000 with equipment. Clair W. Ditchy, 415 Brainard Street, is architect.

Detroit Aircraft Co., 115 Joseph Campau Avenue, Detroit, manufacturer of airplanes and parts, is considering one-story unit at Wayne, to cost about $70,000 with equipment.

Board of Trustees, University of Detroit, Livernois Avenue and Six-Mile Road, Detroit, will soon begin work on two-story engineering building, part of unit to be used as aerodynamical laboratory for aircraft experiments, to cost about $100,000 with equipment. Malcolmson & Higginbotham, 1219 Griswold Street, are architects.

American Malleable Co., Owosso, Mich., manufacturer of malleable iron castings, will erect one-story addition, 75 x 85 ft., for storage and distribution, to cost about $50,000 with equipment.

Fruehauf Trailer Co., 10940 Harper Avenue, Detroit, manufacturer of motor trailers, parts, etc., has acquired plant and business of Warner Mfg. Co., Beloit, Wis., manufacturer of kindred products, and will concentrate production at Detroit. Warner company, however, will continue to operate under present name, as a subsidiary of Fruehauf organization.

Pittsburgh

PITTSBURGH, Dec. 9.—Machine tool business has been quiet so far this month and local dealers do not look forward to much buying before January. A number of the larger lists which have been out are now largely cleaned up and new inquiry is confined mostly to single units. This condition, however, is considered seasonal and it is not thought that buying has been seriously disturbed by uncertain business conditions. Replacements are numerous and local offices are being called upon to furnish many parts for existing equipment.

Railroad buying is not a factor in the market, but a number of the larger carriers have made appropriations which include heavy tool buying and formal inquiry is expected at any time. The Baltimore & Ohio has an inquiry out for some tools on which several dealers are quoting.

Orders for steel mill and other heavy equipment are still reaching local companies and expansion programs announced in the last few weeks will bring additional business. Some companies have orders on their books which will require at least six months for execution and delivery dates are still an important factor in placing business.

Center Foundry & Machine Co., Wheeling, W. Va., will make $50,000 addition to its plant at Warwood, W. Va., which is expected to be completed by Feb. 1. New building to adjoin old plant will be 100 ft. long and will be devoted entirely to molding space. Foundation will be laid by Consolidated Engineering Co. and steel frame will be erected by Wheeling Structural Steel Co., both of Wheeling.

Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, is arranging an expansion program to cost about $32,000,000, divided into fund of $15,000,000 for extensions to plant at New Kensington, Pa., and additions to other plants devoted to fabricating of string alloys from aluminum, including new works in Tennessee; $5,000,000 for expansion in plants given over to production of pig aluminum, and $12,000,000 for development of hydroelectric power for works operation, particularly in Tennessee district.

Firestone Tire & Rubber Co., Akron, Ohio, has asked bids on general contract for three-story factory branch, service and distributing plant at Pittsburgh, to cost about $225,000 with equipment. Lockwood Greene Engineers, Inc., Hanna Building, Cleveland, is architect and engineer.

State Board of Control, Capitol Building, Charleston, W. Va., James S. Lakin, president, is asking bids until Jan. 7 for new vocational training school at West Virginia State College Institute, to cost about $125,000 with equipment.

South Atlantic

BALTIMORE, Dec. 9.—Plans are being considered by Davison Chemical Co., Garrett Building, Baltimore, for two-story addition to commercial fertilizer plant in Curtis Bay district, to cost about $175,000 with equipment. Work will probably begin early next spring.

Leathersteel Products Corporation, John H. Mooney, Garrett Building, Baltimore, president, recently organized to take over and expand company of same name with plant at 173 Long Wharf, Boston, has leased space in local building at Lombard and Frederick Streets. Work has begun on removal of equipment from Boston to new location where production will be concentrated and additional machinery provided for increased output. John I. Peach, Baltimore, is secretary and treasurer of new organization.

Julian P. Friez Co. Division of Consolidated Instrument Corporation, Baltimore Street and Central Avenue, Baltimore, manufacturer of precision instruments, will take bids early next year for three-story addition, to cost about $80,000 with equipment. E. H. Glidden, Jr., American Building, is architect. Headquarters of parent company are at 395 East Forty-seventh Street, New York.

Board of Glynn County Commissioners and City Council, Brunswick, Ga., are arranging for joint airport to cost about $300,000, county and city each to defray one half of sum, to include hangars, repair and reconditioning shops, oil storage and distributing building and other units. F. J. Terras, Brunswick, engineer, has plans.

Board of Trustees, Fort Valley Industrial School for Colored, Fort Valley, Ga., has awarded contract to Aiken & Faulkner, 158 Auburn Avenue, for three-story addition to cost about $75,000. Ludlow & Peabody, 101 Park Avenue, New York, are architects.

Virginia Public Service Co., Charlottesville, Va., is arranging for hydroelectric power plant at Blands Ford, to cost $350,000 with transmission system. Contract for power dam has been let to L. E. Myers Co., 53 West Jackson Boulevard, Chicago.

City Council, Wilson, N. C., is planning extensions and improvements in municipal electric light and power plant, to cost about $300,000 including additional equipment. A bond issue is being arranged.

United States Cold Storage Co., Inc., recently organized, care of A. Epstein, 2001 West Pershing Road, Chicago, engineer, has plans for multi-story cold storage and refrigerating plant at Atlanta, Ga., for which permission recently was secured to take over site now occupied by Atlanta Union Station. It will cost $2,000,000 with machinery. Work will begin early in spring.

Hampton Roads Shipbuilding Corporation, Norfolk, Va., care of S. M. Brandt, Norfolk, attorney and representative, recently organized with capital of $250,000 and 2500 shares of stock, no par value, plans early operation of shipbuilding and repair works in Hampton Roads district. E. E. Gann, Washington, is president.

Page County School Board, Luray, Va., is considering installation of manual

training equipment in new two-story high school to cost about $175,000, for which superstructure will be placed under way at once. Mims, Speake & Co., Luray, are architects.

Cleveland

CLEVELAND, Dec. 9.—Single tool inquiries improved somewhat the past week and the market has a better tone. Some inquiries now coming out, however, are not expected to result in orders before January. Automobile parts manufacturers are busier, some having received large production orders from the Ford Motor Co., and are buying a little additional equipment. One inquiry is for seven turret lathes that will probably be purchased during the week. The Electric Auto-Lite Co., Toledo, is buying machine tools for its plant extensions. The press market, which has been slow the past few weeks shows improvement as manufacturers are now getting quite a few single tool inquiries.

Standard Oil Co. of Ohio, East Ohio Gas Building, Cleveland, is arranging an expansion program to cost $2,750,000, including additions in oil refineries and oil storage and distributing plants, and installation of new equipment.

Libbey-Owens Glass Co., Toledo, Ohio, has work under way on a continuous grinding unit to cost more than $2,500,000 with machinery. When completed, rotary grinding operations at plant will be discontinued.

Sherwin-Williams Co., Canal Road, Cleveland, manufacturer of paints, varnishes, oils, etc., is planning an expansion program representing a total investment of $1,500,000. Work will include addition to local plant to cost $450,000 with equipment; extensions in branch plant at Coffeyville, Kan., to cost about $300,000 with equipment; new storage and distributing plant at Chicago, and additions and improvements in plant at Newark, N. J., to cost $520,000; remainder of fund will be used for expansion in other parts of country.

Ice & Fuel Co., 1421 West Federal Street, Youngstown, will take bids in January for two-story ice-manufacturing plant to cost about $170,000 with machinery. George B. Bright, 2615 Twelfth Street, Detroit, is architect and engineer.

Pennsylvania-Ohio Power & Light Co., 25 East Boardman Street, Youngstown, is arranging for extensions and improvements in plants and system in eastern Ohio and western Pennsylvania, totaling $3,750,000 with equipment. C. S. McCalla is vice-president and general manager.

Indiana

INDIANAPOLIS, Dec. 9.—Fort Wayne Rolling Mills Corporation, 1701 McKinley Street, Fort Wayne, has plans for a one-story unit, 60 x 250 ft., to cost about $100,000 with equipment. Abel-Howe Co., 53 West Jackson Boulevard, Chicago, is engineer.

Josam Mfg. Co., Second and Canal Streets, Michigan City, manufacturer of iron pipe drains, unions, etc., will soon take bids on general contract for a one-story addition. Ahlgrim & Boonstra, Warren Building, are architects.

Packard Fort Wayne Co., 415 West Creighton Avenue, Fort Wayne, local representative for Packard automobile, has plans for one-story service, repair and sales building, to cost about $100,000 with equipment. Pohlmeyer & Pohlmeyer, Central Building, are architects.

In connection with expansion program to cost about $3,500,000, previously announced, Auburn Automobile Co., Auburn, will make extensions in plant of Limousine Body Co., Kalamazoo, Mich., a subsidiary, to cost over $100,000 with equipment.

United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, has superstructure under way on one and two-story and basement plant, to cost about $200,000 with machinery. Work is also in progress on one-story storage and distributing plant, 160 x 160 ft., on adjoining site, to cost about $65,000. Charles E. Bacon, Odd Fellows Building, is architect.

Firestone Tire & Rubber Co., Akron, Ohio, has awarded general contract to Shelby Construction Co., Shelbyville, for one-story factory branch, service and distributing plant at Kokomo, to cost about $100,000 with equipment. Bishop, Knowlton & Carson, 3112 North Meridian Street, Indianapolis, are architects.

Service Products Corporation, 201 South Rural Street, Indianapolis, manufacturer of fans, sheet metal stampings, etc., has awarded general contract to Charles J. Wacker, 3228 Central Avenue, for one-story addition, 132 x 150 ft., to cost about $65,000 with equipment.

Anaconda Wire & Cable Co., Anderson, Ind., has started work on an addition, 90 x 200 ft.

St. Louis

ST. LOUIS, Dec. 9.—Johnston Tin Foil & Metal Co., 6106 South Broadway, St. Louis, will soon take bids on general contract for two-story addition, to cost about $45,000 with equipment. C. F. Deitering, Central National Bank Building, is architect. W. H. McIntyre is head of company, in charge.

Koken Companies, Inc., 3400 Morganford Road, St. Louis, manufacturer of enameled iron barber chairs and kindred products, has awarded general contract to William H. & Nelson Cunliff Co., 3327 Lindell Boulevard, for one-story addition, 80 x 100 ft., to cost $40,000 with equipment.

City Council, Ponca City, Okla., has plans for hangar, 125 x 210 ft., with repair and reconditioning facilities, at municipal airport, to cost over $65,000 with equipment. Part of unit will be used for administration service. E. O. Bennett, 1127 South Seventh Street, is engineer.

Missouri Natural Gas Co., 1107 Olive Street, St. Louis, is planning construction of pipe line from Poplar Bluff, Mo., to connection with trunk line of Mississippi River Fuel Corporation, to cost over $300,000 with booster stations and auxiliary equipment. J. A. Milner is construction engineer for company.

Protective Metals Co., Sand Springs, Okla., is considering plans for new one-story sheet metal plant, to cost over $80,000 with equipment.

Missouri-Pacific Railroad Co., Railway Exchange Building, St. Louis, is considering a new local engine terminal and repair shops near Nicholson and Topping Avenues, to cost about $600,000 with equipment. Appropriation will be arranged in 1930 budget. E. A. Hadley, address noted, is chief engineer.

Cities Service Oil Co., Tulsa, Okla., has awarded general contract to Hercules Construction Co., Wainwright Building, St. Louis, for one-story storage and distributing plant at 4226 Chippewa Street, St. Louis, to cost about $45,000 with equipment.

State Board of Administration, State House, Topeka, Kan., Harry Rhodes, business manager, plans call for bids on general contract early in January for two-story and basement industrial building at State School for Deaf, Olathe, 50 x 100 ft., to cost about $40,000 with equipment. Charles D. Cuthbert, State House, is architect.

Oklahoma Sash & Door Co., East Grand Street, Oklahoma City, Okla., is considering erection of new two-story millwork factory, to cost over $100,000 with equipment. Tools will be electrically operated.

In connection with an expansion program to cost $10,811,000, St. Louis-San Francisco Railway Co., plans new yards and shops at Springfield, Mo., to cost $1,856,000 with equipment.

Great Western Cold Storage Co., Oklahoma City, Okla., has leased building to be erected at Reno Street and Webb Avenue, four stories, 130 x 200 ft., for new cold storage and refrigerating plant, to cost $325,000 with machinery. John J. Harden, Petroleum Building, in charge.

Chicago

CHICAGO, Dec. 9.—Most promising among new developments in this market is a list for about $250,000 worth of machine tools soon to be issued by the Illinois Steel Co. Another industrial list expected at an early date is one from the Allis-Chalmers Mfg. Co. for its tractor plant additions at Milwaukee, and Springfield, Ill. Railroads are slow in making purchases against recent requests for prices on individual items. However, sellers judging by figures requested for budgeting purposes, anticipate a substantial volume of business from the railroads in 1930. It seems likely also that farm equipment manufacturers will buy needed machine tools in larger quantities. Sales the past week were widely scattered and in about the same volume as in late November.

Chicago, North Shore & Milwaukee has plans for car and electric locomotive shops at Waukegan, Ill., to cost $1,000,000. General coach and freight car yards will also be established.

Albertson & Co., Sioux City, Iowa, manufacturers of electric drills and bench grinders, are planning expansion which will increase production 50 to 100 per cent.

Dallas Brass & Copper Co., 6600 West Grand Avenue, Chicago, is planning two one-story additions, to cost about $900,000 with equipment. Company is completing several new units, including engineering building and machine shop, 112 x 161 ft.; addition to brass rolling mill, 125 x 239 ft.; and wood-working shop, 62 x 160 ft. C. D. Dallas is president.

Commonwealth Edison Co., 72 West Adams Street, Chicago, has plans for two and three-story automatic power substation, to cost about $100,000 with equipment, and another substation to cost about $50,000. Company engineering department is in charge.

Mid-West Canning Corporation, De Kalb, Ill., is considering new multi-story plant at Genoa, Ill., to cost about $300,000

with machinery. Company is now operating a branch factory at Rochelle, Ill.

Iowa Public Service Co., Fort Dodge, Iowa, is contemplating power plant at Audubon, Iowa, using Diesel oil-burning engine unit, to cost about $100,000 with equipment.

Board of Education, Le Sueur, Minn., is considering installation of manual training equipment in new two-story and basement high school to cost $150,000, for which plans will be drawn by George Pass & Son, Eckle Building, Mankato, Minn., architects.

Holly Sugar Corporation, Colorado Springs, Colo., is considering rebuilding storage and distributing plant at Torrington, Wyo., recently destroyed by fire with estimated loss over $450,000, exclusive of stock.

Minneapolis Threshing Machine Co., Hopkins, Minn., is contemplating a one-story factory branch and distributing plant at Grand Forks, N. D., to cost about $30,000 with equipment.

Viking Pump Co., Cedar Falls, Iowa, plans immediate erection of a two-story addition, 52 x 152 ft.

Electrical Coal Mining Machinery Co., 309 St. John's Court, Chicago, has secured a site at Danville, Ill., and contemplates erection of a new plant and removal to new location. Company is planning to add to its line of products.

Cincinnati

CINCINNATI, Dec. 9.—While demand for planers and other heavy types of machine tools is lagging somewhat, improvement in orders for lathes and lighter tools are noted. In fact, fresh bookings the past week were much greater than in the preceding two or three weeks. Production in all lines continues at a high rate and no change, at least for the remainder of this year, is anticipated.

The Russian Government has placed an order with a local manufacturer for ten standard lathes of various sizes and a New York company purchased three large lathes.

Bids will be received until Dec. 20 by Board of County Commissioners, Court House, Cincinnati, for automobile service, repair and garage building, and additions to power house and mechanical laundry at County institution, to cost more than $90,000 with equipment. Samuel Hannaford & Sons, Dixie Terminal Building, are architects.

Fyr-Fyter Co., 221 Crane Street, Dayton, Ohio, manufacturer of fire extinguishers, is considering erection of three-story addition, to cost over $85,000 with machinery.

Board of Education, Waverly, Ohio, is considering installation of manual training equipment in new high school to cost about $150,000, for which plans will be drawn by DeVoss & Donaldson, Hollywood Theater Building, Portsmouth, Ohio, architects.

Louisville Gas & Electric Co., Louisville, is arranging an expansion and improvement program to cost $4,950,000, including transmission lines, distributing systems and other work.

Manchester Lime Co., Manchester, Tenn., has plans for two-story storage and distributing plant to cost about $40,000 with mechanical-handling and other equipment. P. A. Stiver is one of heads of company in charge.

Kurz-Kasch Co., South Broadway, Dayton, Ohio, operating a plastic molding works, has awarded general contract to J. C. Gohn, Callahan Bank Building, for one-story addition, 90 x 120 ft., including improvements in present factory, to cost about $50,000 with equipment.

Kentucky Utilities Co., Louisville, operating electric light and power properties, will increase capital from $30,000,000 to $35,000,000, about $2,000,000 of fund to be used for extensions and improvements in generating and distributing plants and system.

Board of Education, Philo, Ohio, is considering installation of manual training equipment in new two-story and basement high school to cost about $300,000, for which plans will be prepared by Richards, McCarty & Bulford, 584 East Board Street, Columbus, Ohio, architects. Bids on general contract will be asked in about 60 days.

Standard Oil Co. of Kentucky, Inc., West Bloom Street, Louisville, is planning extensions and improvements in oil storage and distributing plant in Riverside section, Savannah, Ga., to cost $100,000 including equipment.

Cincinnati-Bickford Tool Co., 3148 Forrer Street, Cincinnati, has awarded general contract to Edwards Mfg. Co., Fifth and Culvert Streets, for one-story addition.

Milwaukee

MILWAUKEE, Dec. 9.—Inquiry and orders for machine tools in this territory show substantial increases and business is reported a little better than normal for the season. The automotive industry is gradually increasing production, and many manufacturers of parts and accessories, especially for trucks and tractors, are well booked for this time of year. Some expansion programs, involving construction of new plants, are scheduled to start in March, but machinery needs are not yet available.

Allis-Chalmers Mfg Co, Milwaukee, has received bids for a one-story addition, 200 x 350 ft., for its Monarch tractor division, at Springfield, Ill., with crane runway and railroad siding. Klug & Smith, engineers, Mack Block, Milwaukee, are in charge.

Wrought Washer Mfg Co, Milwaukee, has moved its subsidiary, Universal Tool & Die Co., into new two-story building at Barclay and Washington Streets, costing $85,000 with new equipment, and will invest $500,000 in rebuilding plant formerly occupied by Beaver Mfg Co., Chase and Oklahoma Avenues, for rerolling mill, raw material storage and shipping facilities.

School District No. 1, White Fish Bay, Milwaukee post office, has appointed M. Tullgren & Sons Co., architect, 20 Prospect Avenue, Milwaukee, to draw plans for new high school, 250 x 520 ft., costing $1,000,000, to include two manual training shops. H. S. Rogers, 230 Birch Avenue, White Fish Bay, is director.

Board of Vocational Education, Racine, Wis., has plans by Frank J. Hoffman, architect, Janes Block, for first unit of new vocational training school, three stories, 68 x 128 ft., to cost about $400,000 with equipment. T. S. Ress, Third Street and Lake Avenue, is director.

Board of Education, South Milwaukee, will rebuild vocational training school destroyed by fire Dec. 2. Site has not been selected. H. Daehling is secretary of board.

Board of County Supervisors, Waukesha, Wis., has appropriated $38,000 for erection and equipment of a new light and power plant at County asylum. William Koheler is County clerk.

Gillette Rubber Co., Eau Claire, Wis., has begun construction of a one-story addition, 56 x 146 ft., to its machine shop. Hoeppner-Bartlett Co., 414 East Grand Avenue, is general contractor.

Layne-Northwest Co., 1023 Wells Street, Milwaukee, has been organized to handle northwestern business of Layne & Bowler, Memphis, Tenn., manufacturer of turbine pumps and other deep-well equipment.

Gulf States

BIRMINGHAM, Dec. 9.—Black Diamond Coal Co., Birmingham, has authorized immediate installation of new mechanical washery at coal mines at Whitwell, Tenn., recently acquired, to cost about $45,000 with equipment.

American Service Co., 705 Walnut Street, Monroe, La., has plans for new ice-manufacturing plant at West Monroe, 100 x 125 ft., to cost about $100,000 with machinery.

Cage Hardware & Implement Co., Chaparral Street, Corpus Christi, Tex., has awarded general contract to T. A. Applewhite, Corpus Christi, for one-story storage and distributing plant, 100 x 140 ft., to cost about $30,000 with equipment. T. W. Crow, Corpus Christi, is architect.

Southwestern Gas & Electric Co., Shreveport, La., is arranging an expansion program to cost about $4,000,000, including additions in generating and transmission facilities in Texas, Louisiana, Mississippi and Arkansas.

Swift & Co., Union Stock Yards, Chicago, have begun superstructure for a one-story plant at Birmingham, on site, 125 x 200 ft., to cost more than $75,000 with equipment.

Rio Grande Oil Co., 225 East Seventh Street, El Paso, Tex., is considering a new refinery, with capacity of about 3000 bbl. per day, to cost over $750,000 with machinery. A large part of plant will be devoted to production of lubricating oils.

City Council, Tampa, Fla., is contemplating construction of hangars, repair shops, oil storage and other field units for new municipal airport, for which a bond issue of $750,000 has been approved. City engineering department is in charge.

Southern Natural Gas Co., First National Bank Building, Birmingham, is arranging for expansion to cost about $7,700,000, large part of fund to be used for pipe line construction in Alabama, Georgia and other States, with new compressor stations and auxiliary structures.

East Coast Refrigeration Co., Lake Worth, Fla., has plans for new two-story refrigerating and precooling plant, 65 x 120 ft., primarily for railroad car service, to cost about $85,000 with equipment. Daniel C. Smith is secretary.

Marion County Power Co. of Florida, recently organized, care of Scott B. Appleby, Jr., 2501 Thirtieth Street, N. W., Washington, has engaged Emmett S. Killebrew, Cordele, Ga., consulting engineer, to prepare plans for hydroelectric power project on Ocklawaha River, Florida, to cost more than $850,000 with transmission system.

Board of Education, El Paso, Tex., is considering installation of manual train-

ing equipment in new two-story and basement high school to cost about $285,000, for which bids are being asked on general contract until Dec. 17. Guy L. Fraser, Martin Building, and Braunton & McGhee, First National Bank Building, are associated architects.

Martin J. Insull, president of Middle West Utilities Co., 72 West Adams Street, Chicago, and associates have acquired controlling interest in Pecos Valley Power & Light Co., operating at Girvin, Tex., and in oilfield districts in western part of State. Company will be consolidated as unit of Middle West Utilities Co. and expansion carried out, including transmission lines.

Wichita Falls Motor Co., 802 Louisiana Street, Houston, Tex., manufacturer of motor trucks, with plant at Wichita Falls, Tex., has acquired building at Lamar and Chenevert Streets, Houston, for factory branch, service and sales building. Repair and parts division will be installed.

Pacific Coast

SAN FRANCISCO, Dec. 5.—Pacific Electric Mfg. Co., 5815 Third Street, San Francisco, manufacturer of electrical specialties, has asked bids on general contract for one-story addition, to cost $50,000 with equipment. R. E. McLane, address noted, is company engineer.

Board of Education, Seattle, plans installation of manual training equipment in one and three-story James Monroe junior high school to cost $600,000, for which bids are being asked on general contract until Dec. 18. F. A. Naramore, Central Building, is architect.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has plans for new steam-operated electric generating plant near Modesto, to cost about $200,000 with equipment. This will be first of three such stations to be constructed in this vicinity. Company engineering department is in charge.

Hood River Canning Co., Hood River, Ore., has asked bids on general contract for new two-story and basement plant, 100 x 100 ft., in St. Johns industrial district, Portland, where operations will be transferred following recent fire loss at Hood River. New plant will include a cold storage and refrigerating unit, and will cost about $75,000 with equipment. Richard Sundeleaf, Guaranty Building, Portland, is architect.

Crown Zellerbach Corporation, San Francisco, has begun expansion at pulp and paper mill of Crown Willamette Paper Co., Camas, Wash., a subsidiary, to cost over $500,000.

Readymix Concrete Co., 575 Berry Street, San Francisco, has revised plans for new plant, to cost $100,000 with equipment. L. H. Nishkian, 525 Market Street, is engineer.

Puritan Ice Co., Lompoc, Cal., plans one-story ice-manufacturing plant, to cost $90,000 with machinery.

Victor Talking Machine Co., North Sycamore Avenue, Los Angeles, subsidiary of Radio Corporation of America, Inc., New York, has filed plans for one-story addition, 90 x 160 ft., to cost about $80,000 with equipment.

Board of Education, Santa Barbara, Cal., has plans for a one-story manual training shop, to cost about $25,000 with equipment. Soule, Murphy & Hastings, 116 East Sola Street, are architects.

Foreign

PLANS have been approved by Phillips Glow Lamp Co., Amsterdam, Holland, for increase in capital from 100,000,000 to 250,000,000 guilders (about $40,000,000 to $100,000,000) part of proceeds to be used for plant expansion and for purchase of other companies in same line.

Secretary, Port and Telegraph Department, Wellington, New Zealand, is asking bids until Jan. 21 for 40 precision tension gages for measuring contact pressure of relay springs, etc., complete with sector-shaped scale.

General Electric Co., Schenectady, N. Y., is considering immediate erection of new plant at Monterey, Mexico, for manufacture of incandescent lamps, to cost about $400,000 with equipment.

A company at Verona, Italy, has plans for a new cold storage and refrigerating plant, including precooling facilities for freight car service, to cost about $260,000 with machinery. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Italy No. 97352.

Barry, Ostlere & Shepherd, Kirkcaldy, Scotland, manufacturers of linoleum, have acquired 20-acre tract at Farnham, Que., as site for Canadian branch plant, with steam power plant, machine shop and auxiliary mechanical structures, to cost over $1,500,000 with machinery.

Officials of Julius Kayser & Co., 353 Fourth Avenue, New York, have organized Julius Kayser & Co., Ltd., of Australia, a subsidiary, to construct and operate a textile mill at Melbourne, Australia, to cost over $350,000 with machinery. Australian Knitting Mills, Melbourne, are interested in enterprise.

New Trade Publications

Arc Welding of Pipe Lines.—Lincoln Electric Co., Cleveland. 12-page folder describing methods of welding, inspection, and test found satisfactory on 17 lines totaling 2491 miles.

Roebling Welding Wire.—John A. Roebling's Sons Co., Trenton, N. J. Broadside illustrating notable construction work fabricated by use of this product.

Wire Cloth and Wire Screens.—Ludlow-Saylor Wire Co., St. Louis. A 36-page booklet gives complete reference data on double-crimped wire cloth and woven wire screens. Illustrations show filter presses, revolving screens, sifters, vibrating screens, driers, strainers, pulverizers and grinding mills, the operation and output of which are controlled with wire cloth and woven wire screens. There are 50 or more extra-heavy screens which have the wire diameter actually larger than the nominal opening between wires.

Fire Brick.—Laclede-Christy Clay Products Co., St. Louis. A four-page folder, issued in the form of a Thanksgiving proclamation, sets forth testimonials by various users of this company's fire brick.

Motor Controller.—Monitor Controller Co., Baltimore, Md. Bulletin 115 of eight pages illustrates and describes an automatic magnetic-reversing, dynamic braking controller for d. c. motors. Approximate weight is from 240 to 275 lb. and average rating 5 hp. or under to 15 hp.

Arc-Welding Sets.—General Electric Co., Schenectady, N. Y. Four-page folder illustrating and describing constant-potential arc-welding sets, suitable for furnishing power to a number of welding stations and for operating automatic-welding equipment. Standard sizes are 400, 500, 750, 1000 and 1500 amperes at 60 volts.

Chamfering Machine.—City Machine & Tool Works, Dayton, Ohio. Four-page folder illustrating and describing new air-equipped Peerless tooth chamfering machine. Base area is 26 in. x 36 in.; spindle speed, 1600 r.p.m.; net weight, 1800 lb.

Metal Paint Primer.—Liquid Metal Products, Inc., 231 South La Salle Street, Chicago. Sixteen-page illustrated pamphlet, outlining uses of Stibloy, a metal compound in liquid form, developed to extend the life of galvanized surfaces. The compound is described as a primer which holds paint, enamel and lacquer tenaciously, permitting the immediate painting of new galvanized steel.

Steel Products.—United States Steel Corporation, 71 Broadway, New York. Fifty-two page book, listing the corporation's subsidiaries, their offices, products and publications.

Spot-Welding Electrodes.—Fansteel Products Co., North Chicago, Ill. Folder describing "Truxeit," a material for electrodes made of copper hardened with tungsten, said to be tough, heat resistant and strong at high temperatures.

Recording Pyrometer.—Wilson-Maeulen Co., Inc., 383 Concord Avenue, New York. Catalog of 8 pages, illustrating and describing potentiometer recording pyrometer for temperature measurement with great width of chart, which permits very close reading. Scale ranges available reach maxima of 200 to 3000 deg. Fahr.

Continuous Centrifugal.—Elmore Centrifugal Products Corporation, 6527 Manchester Avenue, St. Louis. Four-page folder illustrating and describing continuous centrifugals with capacity up to 100 tons an hour. They are capable of deliquefying solid materials from over 20 per cent to 2½ per cent.

Heating and Ventilating.—General Iron Works Co., Cincinnati. Bulletin of 30 pages showing various installations of Hot-Kold system for heating and ventilating and humidifying control. Built in several sizes suitable for home or industrial plants, it is operated by gas.

Apparatus Insulators.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Circular 1858, describing outdoor apparatus insulators which have application for assembling switchgear apparatus, such as bus supports, disconnecting switches, etc. Complete information and test data on company's complete line are included.

Automatic Welding Head.—General Electric Co., Schenectady, N. Y. Four-page folder illustrating and describing an automatic welding head and control with magnetic clutch. Distinctive features are simplicity, sensitivity, thorough lubrication, uniform operation, strong construction and interchangeability.

Precision Measuring Instruments.—S. F. Bowser & Co., Inc., Fort Wayne, Ind. A folder issued by this company describes the Xacto Meter, a precision meter for measuring the amount of

liquid passing through a pipe line by positive volumetric displacement.

Sand Blast and Dust Collecting Equipment. — Pangborn Corporation, Hagerstown, Md. A folder entitled "The Quarter Century Mark" tells of the twenty-fifth anniversary of the company and shows some of the industrial companies which have installed its equipment.

Centerless Grinders.—Cincinnati Grinders, Inc., Cincinnati. A new booklet giving a full description of the No. 3 and No. 4 Cincinnati centerless grinders has been published. Many views of the machines in operation are shown. The company also has issued a bulletin featuring automatic hoppers for Cincinnati centerless grinders.

Arc Welders.—Lincoln Electric Co., Cleveland. A series of specification sheets in bulletin form, describing the 300-ampere "stable-arc" welder in its various forms, driven by direct or alternating current motor or by gas engine, mounted on skids or on wheels.

Conveyor Furnace.—General Electric Co., Schenectady, N. Y. Four-page folder illustrating and describing a mesh-belt conveyor furnace, rated 45 kw., 220 volts, single-phase; conveyor 16 in. wide and 6 ft. long. Capacity is 300 lb. an hour at 1600 deg. Fahr.

Counterbores, Multiple-Operation and Other Tools.—Gairing Tool Co., 1629 Lafayette Boulevard, Detroit. Catalog No. 20, 124 pages, 8½ x 11 in. Describes and illustrates standard interchangeable counterbores, holders and pilots; adjustable extension holders; counterbore sets; back spot facers; offset spotfacing heads; core drills; and reamers, including nose drive type. Swing tool boring heads, multiple-operation tools of both inserted blade and solid type; form cutters, hollow mills and grinding fixtures are among other tooling shown. List prices are given in a separate section, and pages are devoted to interesting applications of standard and special tools. A section is devoted to useful information.

Bus-Bar Supports. — Westinghouse Electric & Mfg. Co., East Pittsburgh. Circular 1825, dealing with Type H bus-bar supports for indoor use. Both standard-duty and heavy-duty supports are treated, with special details of construction, distinctive features and fittings.

Shape Cutting Machine. — General Welding & Equipment Co., Boston. Folder describing oxy-gas automatic shape cutting machine for fabrication of parts from welded structural steel and plate, and illustrating some of the applications.

Oxwelded Piping.—Linde Air Products Co., New York. 24-page booklet illustrating various applications of the welded pipe joint in industrial services and for domestic, office and factory heating systems.

Airplane Fuselage Welding.—Linde Air Products Co., New York. 8-page folder outlining an instruction course for apprentice welders on thin-walled alloy steel tubing and duralumin.

Railroad Electrification. — Westinghouse Electric & Mfg. Co., East Pittsburgh. Publication 1857, describing electrification of Great Northern Railway. Among topics discussed are distribution system, locomotives, operation of system and maintenance of locomotives and equipment.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

CONFIDENCE has been reestablished in all major industries, President Hoover said in his annual message, and he believes that wage rates and agricultural prices will be maintained . . . Industrial leaders met with him in Washington to form a temporary organization to encourage continuity of construction and maintenance work and to remove fear of unemployment.

* * * * *

EXPENDITURES of the national Government next year will pass four billion dollars for the first time since 1921, the expected needs of the Federal Farm Board being responsible for much of the increase over this year, although gradually rising costs in all lines are expected by the President . . . The Treasury refunds its short time obligations at 3⅛ per cent; the last offering was taken at 4⅞ per cent a few months ago.

* * * * *

SURPLUS of receipts over expenditures next year, Secretary Mellon estimates, will be $226,000,000, and he said that it "justifies a revision of our tax laws downward" . . . A resolution reducing income taxes is passed by the House of Representatives . . . Philadelphians will pay a 2.71½ tax rate next year instead of 2.79.

* * * * *

RETAIL trade, woolen goods, and both hard and soft coal trades have benefited greatly by the continuing and widespread cold weather . . . The two leading Chicago mail-order houses report November sales 17 and 21 per cent better than a year ago . . . "A & P" stores, 15,000 in number, sold over one billion dollars worth of groceries and meats during the last 12 months; net profit on turnover was 2½ per cent.

* * * * *

COMMODITY prices continue their slow rise, but wholesale and jobbing trades are very slow . . . Leather prices are decreasing; tanneries in the Central States are engaging in a price war . . . Shoe buying for spring is active.

* * * * *

INSOLVENCIES during November were the third lowest in number of all years since 1921; gross liabilities, however, were higher than last year . . . Fox film interests passed from personal control to that of board of trustees representing firms holding $27,000,000 of promissory notes issued for new theaters and for "talkie" installations.

* * * * *

PETROLEUM output again increases. American Petroleum Institute blames refineries for continuing to produce at a rate faster than gasoline can be sold . . . Sir Henry Deterding of the Royal Dutch Shell interests proposes an international understanding to prevent overproduction, but American producers do not approve his project . . . Cheap tanker rates on crude and decline in Pennsylvania production are responsible for conversion of a trunk line carrying oil eastward into a gasoline pipe bearing refined product westward from the Atlantic seaboard . . . Standard Oil Co. is building three semi-commercial production units to perfect manufacture of gasoline from hitherto unusable asphaltic residues by a hydrogenation process.

* * * * *

NATURAL gas lines leading from Monroe, La., northward to St. Louis and eastward to Birmingham, commence delivery of about 150,000,000 cu. ft. daily . . . Drilling in five localities near Washington, Pa., increases the daily gas production of that region by 15,000,000 cu. ft.

* * * * *

FORD Motor Co. increases minimum wage to $7 a day, and all salaried and hourly rates about 5 per cent . . . Employment gains somewhat in Detroit, as next year's models get into production . . . Total production of American cars during 1929 will reach 5,600,000 units; about 1,000,000 more than last year and considerably more than automobile executives are predicting for 1930 . . . Chrysler show rooms in New York are exhibiting extensive line of radios, thus endeavoring to maintain sales organizations during slack months . . . General Motors asks the French Government to revise its appraisal policy so that imported cars will be valued for duty purposes at retail price less selling cost. Duty is 45 per cent; nevertheless about 4000 American cars are imported annually, and about 10,000 Fords are assembled in that republic.

* * * * *

UNIFICATION of all rail, subway and motor bus transportation in the London area under Government ownership and private operation is the aim of Premier MacDonald—a plan branded as "socialistic" . . . An order imposing a 5-cent fare on the Los Angeles trolley system is nullified by the Supreme Court . . . After a 6-year trial of a basic 5-cent fare, during which time the earnings fell $3,300,000 below a 7 per cent return, the New Jersey Public Service lines are authorized to charge a 10-cent basic fare for casual riders for an experimental period.

* * * * *

MARINES were dispatched to Haiti to reinforce the 700 on duty there and to help to subdue rioting. President Hoover asked for a Congressional commission to study conditions on the island and formulate recommendations for future action . . . Secretary Stimson was joined by European powers in sending notes to Russia and China calling for cessation of hostilities in Manchuria, an action resented by the Soviet Government. A mutually satisfactory armistice is reported, however . . . Construction of the remaining three of the first five cruisers of the naval program will be delayed until after the limitations conference at London, but funds are provided in the budget for completing all of them by June, 1933.

THE IRON AGE

New York, December 19, 1929

ESTABLISHED 1855 VOL. 124, No. 25

Thorough Studies Lower Shop Costs

Review of All Problems Incidental to Production Costs Necessary—Bonus, Premium or Other Wage Incentive Not Always the Only Cure

BY CRIS BERG*

DEFINITE benefits accruing from rational application of a bonus or premium system of paying for work done are outlined in this article. Specific analyses for three separate departments show similar, but unequal, gains in daily output. But these are not haphazard results; they accrue as the reward of a thoroughgoing study of the problem for each individual operation and for the shop as a whole.

IN many instances efforts made to reduce costs are not in themselves sufficiently broad and complete to attain results which are possible. Further, it often happens that an accomplishment of a reduction in cost is taken as a finality, without regard to a thorough coordination of men, methods and machines through which further lowering of cost may be possible. It is manifestly unfair to the equipment manufacturer if the whole burden of cost reduction is placed on his machine, when at the same time the flow of material, instructions to employees and other unfavorable conditions virtually strangle the machine, and keep it from doing work in the manner and in the quantity for which it was designed.

Wage incentive schemes or plans, whether piece work or bonus, cannot be considered as cure-alls for all of the evils of high cost of production. First of all it is necessary that the wage incentive be applied on the basis of studies which should follow the correction of miscellaneous factors, all of which will have an important bearing on whether or not the net outcome of the wage incentive plan will be successful.

How One Concern Attacked the Problem

Three tables herewith show data prepared from three departments in one manufacturing concern. It will be noted that, in the cases of the foundry and the machine shop, comparisons are drawn between wage incentive plans and day work. In the case of the structural shop the comparison is between a new premium system and an old premium plan. In each case the new plan, figures for which are given in the right-hand columns of the tables, on the following pages, was put into use only after studies of the entire shop problem.

The old-style premium system in the structural shop had been put into use without study of surrounding conditions. Consequently the average saving resulting from the new plan was higher in the case of the structural shop than in either the machine shop or the foundry, where day work had continued in practice. This demonstrates the need for a complete study of shop conditions, and also shows the fruitlessness of applying wage incentives without first rectifying as many as possible of the bad practices which tend to offset the advantages of a wage incentive scheme.

Thorough Study Is Essential

Thus the problem resolves into one of adequate and thorough study of all conditions which have a bearing on manufacturing cost. It often extends beyond the shop doors to the stockroom, and even to the clerical force in the office. Any accomplishment in the way of cost reduction should be taken as an incentive to search further under the assumption that work of this character is never finished.

There remains only to find the way which leads to still lower manufacturing cost. Sometimes this is accomplished by the purchase of new equipment; often by speeding old machines; by the rearrangement of manufacturing units; wage incentives; handling of orders and materials, and by a proper method of routing. Always, however, the best results are obtained when all the above factors are developed as far as possible, and so synchronized that one is an aid to the other.

Finding the "Neck of the Bottle"

FROM a plant where new equipment recently was installed, with the expectation that no further effort would be necessary to increase production and to cut cost,

*Consulting engineer, Chicago.

Table I.—Gray Iron Foundry Work

Kind of Piece	Weight of Casting per Piece	Day Work: No. of Pieces	Day Work: Time in Hours per Piece	Piece Work: No. of Pieces	Piece Work: Time in Hours per Piece	Increase in Production, Per Cent
Stands	20 lb.	15	0.70	15	0.50	40
53-in. gear	500 lb.	1	6.00	1	4.00	50
56-in. gear	900 lb.	1	9.00	1	4.50	100
End castings	30 lb.	15	0.40	15	0.24	66
Worms	40 lb.	6	0.33	10	0.20	65
Plunger	330 lb.	2	3.50	2	2.20	59
Drum	350 lb.	12	4.00	12	2.00	100
Frame	100 lb.	6	1.70	10	1.00	70
Core work—rollers	18 lb.	200	0.18	200	0.11	64
Core work—clutch	238 lb.	2	1.00	2	0.50	100
*Total and average			136.68		78.20	75

*Based on number of pieces in day-work column.

the following illustration is taken. The burden was placed wholly on the new equipment. Neither effect was realized except in a small way, because the flow of material formed the neck through which, without readjustment, greater production was impossible.

A new drying oven was installed, with many distinctive improvements over the old ovens. Ahead of the oven were two chain conveyors, the first one feeding to the second, which carried the product through the oven. After trial operation of many weeks, the only benefit derived was that of lower fuel cost. The oven could not be worked at capacity, simply because the conveyor was not loaded heavily enough. The conveyor could not be fully loaded because raw material did not move from the storeroom to the manufacturing department in properly proportioned lots. The stores department was to blame only in part, because the order department took no recognition of the problems involved in the actual manufacture of the product.

It was the practice of the order department to tabulate incoming orders until an (arbitrarily assumed) sufficient number of pieces of each kind had accumulated so that an order should be given to the shop. When this stage had been reached an order was issued on the factory, by way of the material storeroom. There the storekeeper, without a knowledge of shop conditions, used hit-and-miss judgment in sending material to the shop. He often separated items on an order, sending first to the shop that material which was easiest for him to handle or to take from stock.

The results were two-fold. Work went through the shop in slugs, and parts of an order often remained in the storeroom for a month, delaying shipment of the complete order far beyond even the unnecessarily long time required to get the first part of the order through the shop. This unsystematic method of handling orders and materials, which resulted in the unbalanced loading of the conveyors, so hampered this plant that it was able to ship finished products on only about one-half of the working days in each week.

Correcting Bad Conditions

The remedy was simple. The expenditure for the new oven having already been made, the only further outlay necessary was a few hundred dollars whereby the two conveyors were mechanically adjusted to cover all necessary conditions of loading. There was established also a scheduling department which was responsible for loading of the conveyor so that a properly correlated assortment of parts passed through the oven each day. This solved the problem in the shipping room, from which finished materials started to move every day.

Purchase orders are now forwarded without delay to this scheduling department. There an analysis is made and material is ordered out of stores in such quantity and in such sequence that the conveyor will neither be clogged nor only partly loaded. The schedule is such that finished parts will reach the shipping department in such quantity and assortment that orders may be promptly filled and promises of delivery kept.

As a result of the new management methods, the oven exceeds the rating given it by its manufacturer. Above all, the output of the shop was more than doubled, with only a small increase in labor needed to load and unload the conveyors.

Three Departments Show Large Gains

CONDITIONS similar to the above are not confined to any one phase of manufacturing. Recently a 76 per cent increase in production was made possible in the jobbing foundry referred to in an early paragraph simply by rearrangement of working space and equipment and installation of a wage incentive. Before changes were made the men were paid by the day. Molding machines were available, but they were poorly located with respect to the shop as a whole. Molders, after having finished a job, left the floor in search of a new one and the pattern necessary for it.

One of the first steps taken to revamp methods in this foundry was to study the flask situation. The assortment was, generally speaking, satisfactory for the run of work at hand. However, the storage space was unhandy with respect to the molding floor and flasks were piled with no regard to type or size. Hence much expense was incurred in sending them to storage, digging out the flask needed and again returning it to the shop. A handy storage space and orderly stacking overcame this difficulty.

Table II.—Machine Shop Work

*Total and average			381.36			177.30		115

*Based on number of pieces in day-work column.

Foremen were instructed to watch the progress of jobs and anticipate their completion, and to have delivered promptly to the molder the pattern which the schedule called for next. The layout of the floor was planned so that products now move progressively down aisles of ample width. This relieves congestion at the molding machines, making it possible for them to produce at rated capacity.

Piece work was based on a thorough motion study. The results were that output was increased over 75 per cent; not an extra man was employed; no expenditure was necessary for new equipment; the cost of production was lowered and the men were allowed to earn about 33 per cent more a day than with the old day rate.

Table I shows the increase in production brought about by the new methods. Figures are given for a number of miscellaneous items, some of which were made in single pieces, while others went through the shop in lots up to 15 pieces in each. The time required to make a single 56-in. gear was cut in half. The saving in time of making cores showed 64 per cent and 100 per cent increase in hourly output for the two jobs was accomplished.

How the Machine Shop Was Benefited

In Table II are shown results obtained after putting into practice improved methods in the machine shop. No new equipment was purchased, as most of the machine tools on hand were of recent design. Machine speeds were adjusted; cutting tools were properly ground; machine tools were rearranged with reference to the sequence of operations to be performed.

Special attention was given to the methods and time for setting up jobs in the machines. A material routing system was put in operation and both the men at the machines and the foremen were given advance information, so that they could plan a set-up ahead of time and have tools and material ready to start the new job. Time studies were made and piece work and a premium system of payment supplanted the old day rate.

Production in the shop was increased on the average, 104 per cent. The use of piece work resulted in a gain of 135 per cent, and on those jobs where the premium system was used the gain was 70 per cent.

Gains in Structural Fabricating Shop

Basis for establishment of a premium system may be at fault, and that, combined with other unfavorable factors, may choke shop production. The structural fabricating shop had for some time made use of a premium system which had been roughly based on records of day-work cost. It had been expected that the magic word premium would bring low cost. Little effort was directed in that early attempt at conditions under which the work was performed.

Some time was spent in the recent change in rearranging machinery. Aisles were cleared and material to be worked was carefully classified and piled in an orderly manner, convenient to the various machines. Then time studies were made and a new premium system was built from them. The workmen were instructed now to make the best possible use of the equipment.

Results attained are shown in Table III. The average increase in production was 106 per cent. It is noted that the production increase in several cutting operations ranged from 1 per cent to 300 per cent. This divergence in itself was clear proof that hit-and-miss production methods had been in use and that improvement was overdue.

When studies were completed, instructions were written covering each operation. This was done so that workmen and foremen could duplicate conditions for a specific job even though it might not get into production again except at long intervals.

Standard Speeds and Feeds Important

Often there is lack of interest in applying standard speeds and feeds in machine shops which are run on day work. It has been shown time and time again that the use of these standards is habit-forming among workmen and these habits become especially valuable in shops where day work and piece work are mixed. Once the men become accustomed to operating a given size drill at its proper speed they will of habit maintain these standards on any work which passes through their hands. It is therefore to be urged that standard speeds and feeds be specified for all classes of work throughout the shop.

A point often overlooked is the checking of patterns, to ascertain whether or not the castings will carry extra metal which later must be removed at unnecessary expense.

With reference to the attitude of the workmen, it should be impressed upon them that the possibility of earning higher wages depends on maintaining new conditions and on following instructions. No method is long satisfactory which is not closely adhered to. Finally, regardless of whether new or old equipment is used, one must coordinate all factors which contribute to the problem of production. Then the workman can be at his best.

Making Aluminum Aircraft Castings

Careful Heat Treatment Needed—Temperature Control of Melting a Feature—Wood and Metal Pattern Shops

BY FAY LEONE FAUROTE*

TWENTY Bellevue oil-fired furnaces are employed in melting metal for castings in the foundry of the Wright Aeronautical Corporation, Paterson, N. J. All the melting furnaces are located in one room in the center section of the main floor. The casting floors, equipped with roller conveyor tables made by Eastern Steel Castings, Newark, N. J., have been installed at convenient points in front of the entrance of the furnace room. Aluminum "Y" metal is used for cylinder heads and pistons, the pouring temperature of the "Y" metal being about 1300 deg. Fahr. For the crankcase castings the Aluminum Co. No. 195 metal is specified.

A pyrometer room equipped with Wilson-Maeulen Co. apparatus makes it possible for the temperature of each furnace to be read at any time. Here the observer may signal, by means of three electric lights mounted at a convenient point on the ceiling, when the metal is ready for pouring. A green light indicates that the furnace is coming up to heat; a red, that the temperature is excessive; and a white, when the critical pouring temperature is reached. In addition, the temperature of the metal in the ladle of each heat is ascertained by a pyrometer inserted just as the metal leaves the furnace room. Later each casting is stamped with the number of the heat, and thus a complete check on each heat is obtained.

After the castings have been shaken out they are taken to the cleaning room, where the gates and risers are sawed off by power-operated band-saws. Later they are chipped by pneumatic hammers, snagged, pickled, sand-blasted, stamped and given a careful inspection. The piston castings are rough turned outside before being heat treated, so that there may be uniform heat penetration.

Annealing and Aging the Castings

After the castings are made, it is necessary to reheat them to remove the casting strains and also to age the castings, to improve their tensile strength. This process is accomplished in an electrical truck loading oven, with outside dimensions 9 ft. wide, 9 ft. deep and 7 ft. high. It handles two cars 3 ft. wide by 6 ft. 9 in. long, each heat. The oven is electrically heated with a connected load of 60 kw., provided with automatic temperature control, and the range in operating temperature is from 200 deg. to 700 deg. Fahr., depending on the particular process under way. The circulating system with which

WOOD Pattern Shop Layout in Wright Aeronautical Foundry. This is on the third floor of the building and, as the diagram shows, has excellent day lighting all around. Automatic sprinklers protect pattern shops and storage from fire danger

this oven is equipped provides most uniform heat distribution.

All of the crankcase parts, the pistons and cylinder heads are heat treated or annealed in electric furnaces at 960 deg. Fahr. The cylinder heads and pistons are aged at 400 deg. Fahr., and the crankcase sections at 212 deg. Fahr., in Gehnrich indirect-heat ovens.

All three parts are then pickled by immersing in hot caustic soda, followed by a nitric acid solution. The floor of the pickle room is protected by a pavement of acid-proof brick and the walls are coated with paraffin. After a final washing, the parts are taken to the inspection room and carefully explored for checks, cracks and other defects.

Some castings which are imperfect show up blow-holes. After the preliminary grinding these are pre-heated in (three) welding furnaces or ovens to a temperature of 900 deg. Fahr. and the blowholes then filled up by welding in on the hot castings. The ovens are of the car type, each oven having outside dimensions 6 ft. 8 in. wide, 7 ft. 4 in. long, 7 ft. high, and handling a car 36 in. wide by 72 in. long. Ovens are oil heated and operate at 800 to 900 deg. Fahr. The oil system operates from 16 oz. air pressure and 25 lb. oil pressure. There are a number of stands for oxygen-acetylene blowtorch welding.

To shrink the finished cylinder-head fin body on to the steel cylinder, the heads have to be expanded by heating to a temperature of 750 deg. Fahr. This is accomplished on a continuous conveyor running through an electrically heated Gehnrich oven. The equipment is entirely automatic in its operation, in that the operator at the unloading end, by a series of push buttons, may open or close the door at either end of the oven or progress the conveyor. Heating is entirely automatic, with automatic temperature control, and provides a continuous record of the heat cycle through which the castings pass.

After the cylinder heads are shrunk on the cylinders, they are black japanned and this japan finish baked in an electrically heated, truck-loading type oven having two compartments. The crankcases and other parts are finished with a gray enamel and these parts are baked in an electrically heated, truck-loading type oven with three compartments.

Pattern Shops on Two Floors

ON the second and third floors are to be found the metal pattern shop and wood pattern shop respectively. These and the pattern storage department in the basement are the only parts of the building equipped with automatic sprinklers. Equipment in the wood and metal pattern shops is extensive and adequate. An electric elevator runs from the pattern storage department in the basement to the pattern shops on the second and third floors.

In one corner of the metal pattern shop are three automatic metal band-saw filing machines and an automatic band setter. The entire time of one man is here required to keep the supply of sharpened band-saws ready for the department below, one saw lasting only about 3 to 4 hr., after which it must be re-filed and occasionally reset. Each bench in the metal pattern shop has both air and gas available.

At present about 250 men are employed in the Wright foundry, 50 in the pattern departments, the remainder engaged in sand-mixing, core-making, molding, shaking out, cleaning, sawing, chipping, filing, pickling, heat treating, inspection, supervision and maintenance. The foundry offices, on the first floor, adjoin the inspection room.

Services Provide Comfort for Men

In both the foundry proper and the pattern shops, very efficient ventilation systems have been installed, so that linseed oil fumes, smoke, obnoxious gases, wood and metal dust are almost wholly withdrawn from the air. The ventilating systems for the pickle house consist of wooden ducts with a wooden fan outside of the building, discharging into a wooden stack. In the heat-treating room is equipment for air-cooling the castings, consisting of pits in the basement, through which air is blown by fans. The exhaust is used for heating the basement in winter, with a by-pass to the atmosphere in summer. These

ELECTRICALLY Heated Enameling Ovens, the Enamel Being Applied While Crankcases Are Held on Fixtures, as Shown. Japanning ovens are similar to these

ventilation systems are believed to be largely responsible for the complete absence of the smoky haze usually observed in foundries. No iron casting is done—only aluminum, kelmet metal and some bronze.

Interior walls in all departments are painted white down to shoulder height, below which they are dark. This, together with the large window area, entirely obviates the necessity for artificial interior illumination except during the late hours of the afternoon in winter.

Even the basement is well lighted and clean. It contains, in addition to sand storage bins, metal, pattern and general storage, the air compressor room, the oil supply pumps, the lower section of the electric heat-treating furnaces, a large, well-ventilated metal locker room, a spacious wash room equipped with Bradley Washfountains, a row of shower baths and toilets. In addition to this there is ample space for a rest room and cafeteria, which may be installed later. Aluminum alloy "ingots" are stored in the basement on sheet steel floor skids, which are handled by electric lift truck to the elevator and thence to the melting furnaces.

Along the ceiling of the basement runs the piping for the equipment above, such as high-pressure air, low-pressure air, fuel oil, gas, water and steam. The main distributing switch room is located in the basement also. To this is supplied 4150 volts of Public Service current, transformed here to 440 volts for power and 110 volts for lighting. Feeders run to the different power and lighting panels for all of the lights, motors, and furnaces.

In the basement the partitions of the sand bins are of wood, but all of the others, such as those of the metal storage and pattern storage, are of wire grating. This allows free circulation of air and an unobstructed penetration of light.

A spur track runs along the outside wall, the full length of the building on one side. This makes it possible for the incoming sand to be chuted directly to the bins by portable conveyor. Incoming metal is unloaded from cars on to a spiral gravity conveyor which dumps it out on to a metal truck frame, which needs to be wheeled only a few feet inside of the metal storage room. From there it is transferred to the furnace room on the main floor by a sidewalk-type elevator of 3-ton capacity.

Heat is supplied to the building by unit heaters. Those on the main floor are fed by steam at high pressure, and the trap discharge at low pressure is used for supplying unit heaters in the basement, which operate on a vacuum system, the condensate being returned to the boiler room. A 20,000-gal. fuel oil tank is buried outside at one end of the building, and the oil is pumped to the core ovens, melting furnaces and elsewhere as needed. A 10,000-gal. core oil tank is in the yard, near the fuel oil tank.

Tying Up Production Control with Materials Handling

AN electric washing-machine manufacturer, before installing an overhead tramrail system, had the usual type of stockroom, consisting of long rows of bins in which the smaller parts were kept, and four-wheeled trucks cluttered all over the place, in which the larger parts were kept. Operation of this plant was described before an engineering meeting in Akron, Ohio, by E. T. Bennington, Cleveland Electric Tramrail Division, Wickliffe, Ohio.

In assembling several models, several thousand different parts were used, consisting of screw-machine products, castings, pressed-metal parts, bars, angles, motors, switches, etc. The material was withdrawn from stock in the usual type of tote box of a size which would hold about 50 lb. of small screws. As an operator ran out of material his supply was replenished in containers of this size or in bundles of angles, rod, etc., depending upon the nature of the material being used.

If the stock of only one small part should unexpectedly become depleted, no more machines of this model could be assembled until the supply was replenished.

Definite Stock Runs Established

This manufacturer took the first step toward successful handling of his material when he established a definite stock run for each model of machine. He then purchased 300 steel containers, all of the same base dimensions and varying only in height. The cubical capacity of these containers was fixed so that there was a size to hold the exact quantity of any part required to complete the previously established stock order.

Assume that the established stock order of model X machines was 500. The purchasing department would purchase the various parts required, in the quantity which provided the lowest overall price.

When these parts were received, 500 of them would be put into one container, if only one piece was used on each machine. If ten pieces were used on each machine, 5000 would be placed in the proper-size container as they were received, and checked in the receiving department.

Where parts were too large to get into one container in quantities of 500, these were placed in two containers or five containers, and those containers plainly marked ½ stock order or 1/5 stock order, to conform to the quantity they held. There were also a few cases where several kinds of very small parts were grouped into one container. These were parts which did not require any manufacturing operations before assembly. They were placed in this container in such a way that they did not become mixed up, being separated from each other by partitions.

Those parts which did not require manufacturing or finishing were moved to the machines as the schedule of each department permitted. After the completion of the machine operation they would be moved back into stock to await assembly. This relieved floor congestion in the manufacturing department.

Better Control Over Operations and Stock

Aside from the saving effected in handling large units at one trip, and eliminating rehandling, the inventory system, cost system, and record of material lost in manufacturing operations could be more accurately accounted for.

Since a tramrail system was employed to handle these containers, with a special automatic grab that enabled the operator to attach or detach the load from the cab without the aid of anyone on the ground, these containers were piled four or five high, and aisle space was entirely eliminated. The capacity of the stockroom was increased about 400 per cent, and the cost of a new building which otherwise would have been necessary under the old scheme of things was saved entirely.

Hardness of Brinell balls for hardness testing machines has been investigated by the British National Physical Laboratory. For these very hard steels a Vickers hardness tester using a diamond cone is suitable. Brinell balls for testing steels whose hardness number does not exceed 500, should have a diamond hardness number (corrected for the curvature of the ball) not less than 900. For Brinell tests on material between 500 and 630 hard, "work-hardened" balls should be used. A file test can also be used as a rough indication of the surface hardness of balls. If a ball can be scratched by a new smooth file its corrected diamond-hardness number is probably below 850.

Strength of Zinc Base Die Castings

Improvement Has Been Large Recently—Gravity and Pressure Methods—Types and Relative Merits of Alloys Available

BY ROBERT M. CURTS*

ONE of the outstanding features in the recent development of zinc base die casting alloys is the remarkable improvement which has been made relative to physical properties. These improvements have been brought about through a systematic study of the effect of the deliberate addition of other metals to zinc, and by a careful study of the effects of certain metallic impurities which are likely to occur in the raw materials or which sometimes occur because of thoughtless contamination. Zinc base die casting alloys are now available which will make strong, sound and permanent castings. Tensile strength of from 45,000 to 50,000 lb. per sq. in. and initial impact strength of well over 100 ft.-lb. per sq. in. can now be obtained through the specification of the proper zinc base alloys.

Inasmuch as zinc base alloys are cast by several methods, and because the casting method not only determines the type of alloy which can be used but also influences the physical properties of the castings, it seems advisable to briefly consider these several methods and to limit the major part of the following dissertation to the one type which recently has become so popular.

*Technical Service, New Jersey Zinc Co., New York.

Gravity and Pressure Methods Compared

In a broad sense, the term die casting includes both gravity and pressure castings. As implied, the former method relies on the force of gravity to distribute the

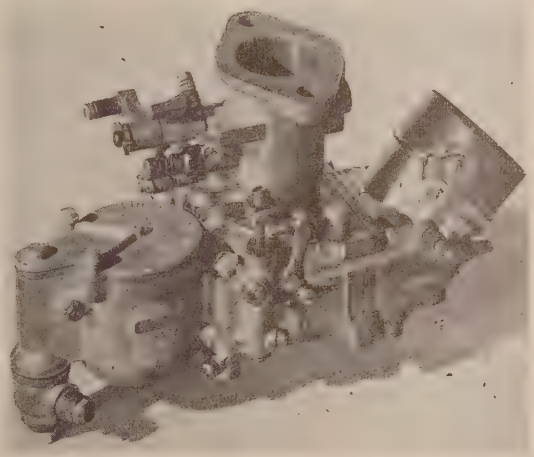

Fig. 2—Automobile Carburetor Made Up of Several Assembled Zinc-Base Die Castings (Above)

Fig. 1 — Ornamental Zinc Lamp Base Made by the Hand - Poured Gravity or Slush Casting Method (at Left)

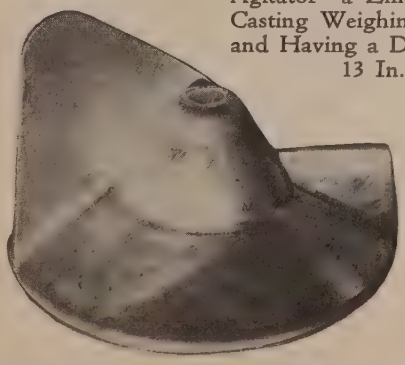

Fig. 3—Washing Machine Agitator—a Zinc-Base Die Casting Weighing 7¾ Lb. and Having a Diameter of 13 In.

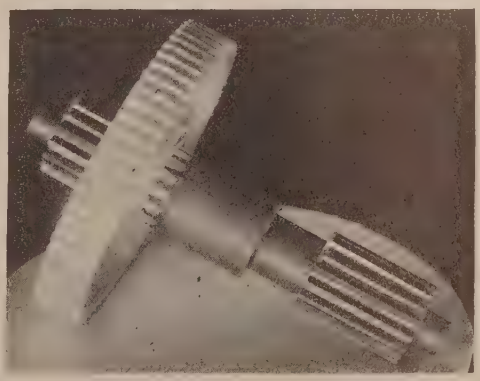

Fig. 4—Idler Gear for Speed Reducer Used on an Electric Hoist. Note the 4- in. (diameter) gear which has been cast around the 1⅛-in. axle

molten metal throughout the various cavities of the die, while the latter method employs the application of artificial forces, either pneumatic, mechanical, or a combination of both. In this process pressures ranging from less than 100 lb. per sq. in. and up to 2000 lb. per sq. in. are used. The higher pressures are usually employed where high rates of production are necessary and where the appearance of the surface is a primary factor.

Gravity castings are sometimes classified as slush castings (Fig. 1) and permanent mold castings. They are usually hand poured and necessitate the use of alloys having rather high fluidity. It is quite common practice to use high-grade, unalloyed zinc for this purpose. Castings of this type have a relatively low tensile strength (8000 to 10,000 lb. per sq. in.) and are used primarily in the production of ornamental objects and toys. Stronger castings may be made by the gravity method by using zinc alloys containing aluminum, copper and,

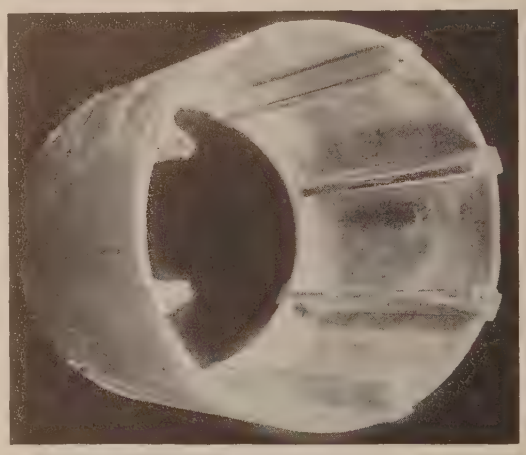

Fig. 5—Electric Hoist Motor Housing—(Weight 5 lb., Length 6 in., Diameter 6 in.). Note the design of the casting which distributes the shrinkage about the core and which allows minimum weight and maximum strength. The ⅛-in. walls are reinforced with eight ⅜-in. ribs which are an integral part of the casting

sometimes, magnesium—although the addition of these metals to the zinc influences the casting properties and often necessitates greater care when used in connection with complicated dies.

Possibly many readers have not realized the possibilities of zinc base alloy castings because they have considered castings of this gravity type only. Pressure die castings are invariably much stronger because of the difference in the structure of the cast metal, and because the types of alloys which can be cast by this method are very much stronger. Increased impact and tensile strengths, together with greater ease and rapidity of casting, have popularized the pressure casting method to the extent that it consumes about 90 per cent of the zinc and zinc base alloys now used in castings.

In order to prevent any confusion, and because pressure die castings are by far the most widely used, the author limits further discussion to this field.

The automobile industry consumes well over 50 per cent of the zinc base die castings which are now being produced, although the past year has witnessed the introduction of similar castings into many new and interesting fields. Practically all automobiles are equipped with castings made of the newer and stronger zinc base alloys. The recently perfected and widely adopted fuel pump, illustrated by Fig. 6, is made of Zamak, the 4-3-0.1

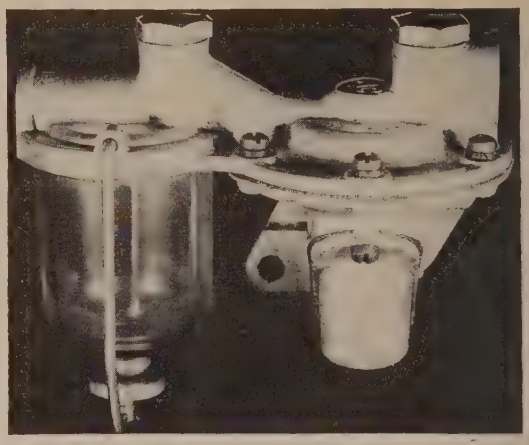

Fig. 6—Automobile Fuel Pump Composed of Two Die Castings Made of the 4-3-0.1 Alloy

alloy, which will be discussed in detail later on. Carbureters, lamp housings, cowl lamp brackets, windshield wiper housings, steering wheel parts, radiator caps, magneto and generator housings, spark and throttle levers, emblem bars, robe rail and foot rail brackets, instrument panels, speedometer parts, inside and outside hardware, clock frames and numerous other parts are now made of zinc base die castings.

Many Kinds of Zinc Base Castings

Varieties of zinc base die castings are also employed in the manufacture of numerous other articles, such as sewing machines, printing press accessories, moving picture machines, check writers, lighting fixtures, fractional horsepower motors, washing machines, gears, vending machines, sun lamps, toys, cash registers, locks, pencil

Fig. 7—Bronze-Plated Door Knocker Made of a Zinc-Base Die Casting

sharpeners, door closers, weighing machines, spray guns, radio chassis, radio loud speakers, plumbing fixtures, general house and furniture hardware, etc.

In scanning the foregoing list, it is at once evident that many of the applications noted impose rather exacting demands relative to tensile strength, resistance to breakage by impact, freedom from growth, and retention of physical properties. The improved zinc base alloys which are now being used are meeting these requirements. Not only do they meet specifications relative to strength, but they also lend themselves to the application of a great many attractive finishes including enamels, lacquers and almost any kind of plating. Nickel, chromium, cadmium and other metals commonly used for plating may be applied without difficulty.

The evolution of the strong alloys which may be had today is not the result of chance findings or over-night discoveries. It has been a slow evolution in which many factors had to be considered. Many alloys were made and tested. Primarily, research investigators sought alloys having high impact strength. But having accomplished this, their job was not finished. Ageing, due to intercrystalline oxidation and internal phase changes,

Fig. 8—Steel Inserts Used in Connection with Automobile Hardware

was determined for the alloys considered, and many of them had to be discarded because they failed to stand the tests to which they were subjected. Many other alloys "fell by the wayside" because they did not have suitable casting properties—for a good all-around alloy must not only have great strength, but must be free from hot shortness (cracking in the dies), and must have good fluidity and a liberal casting range. From the standpoint of finishing it must be easily machined, buffed, and plated.

Three Types of Die-Casting Alloys

At the present time there are three types of die-casting alloys in general use. The properties and merits of these alloys are reviewed in the following paragraphs:

1.—The commonly termed "Tin Alloy" contains approximately 6 per cent tin, 3 per cent copper, 0.5 per cent aluminum, and the balance zinc. This is one of the more antiquated zinc base alloys and has practically been displaced by the newer and stronger alloys. It has a relatively low tensile strength (approximately 24,000 lb. per sq. in.) and a low impact strength (17 to 28 ft-lb. per sq. in.). It has an elongation of from 1 to 1.50 per cent in 2 in. and a Brinell hardness of from 57 to 61. Such physical properties did not invite the use of this type of alloy for the hundreds of applications which die castings are now serving. About the only justification for the use of this alloy, scant though it is, is that it is quite readily soldered. Soldering and the tin alloy go hand in hand, for a "chain is no stronger than its weakest link" and if a weak soldered joint is necessary, a weak casting will serve. From the economic standpoint, this type of alloy is probably more expensive than the newer alloys because, although a low grade of zinc may be utilized, the cost of the copper-aluminum-tin combination with low-grade zinc will exceed the cost of the copper-aluminum and the copper-aluminum-magnesium combination used with high-grade zinc in the most recent alloys.

*United States Patent No. 1,596,761, Aug. 17, 1926.

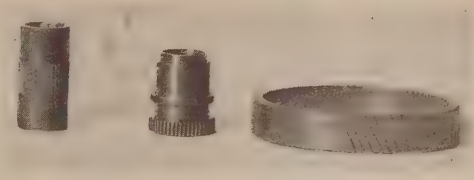

Fig. 9—A Group of Brass Inserts

2.—The 4-3 or 5-3 alloy contains from 4 to 5 per cent of aluminum, 3 per cent of copper, and the balance high-grade zinc. This type of alloy has a tensile strength ranging from 37,000 to 43,000 lb. per sq. in. and an impact strength of about 100 ft-lb. per sq. in. as cast. It has an average elongation of 2 to 3 per cent in 2 in. and a Brinell hardness of about 80. It has very good casting properties, being quite fluid and free from hot shortness. It can be cast with a smooth, even, fine-grained surface which facilitates subsequent buffing and plating operations, to which it is frequently subjected. It is easily machined and can be used in connection with steel, brass, bronze and other types of inserts.

3.—The "4-3-0.1" alloy (Zamak)* is composed of 4 per cent aluminum, 3 per cent copper, 0.1 per cent magnesium, and the balance high-grade zinc. This is the most recently developed alloy and, in many cases, it has replaced alloys of the 4-3 and 5-3 types. With a tensile strength of 47,000 to 50,000 lb. per sq. in. and an impact strength of well over 100 ft-lb. per sq. in., this alloy is undoubtedly the best available at the present time. It should be employed when long life and service are required of the finished casting. It is easily cast in complicated dies, although some care must be exercised in the gating of the die in order to prevent overheating which may result in cracking. It affords a smooth, hard, fine grained surface which is particularly suitable for plating and other finishing operations. It can be soldered, if necessary, although soldering is to be discouraged because a soldered section usually weakens the casting as a unit. The 4-3-0.1 alloy is somewhat harder than the tin alloy or the 5-3 or 4-3 type of alloy, having a Brinell hardness of from 80 to 90. It is easily machined and

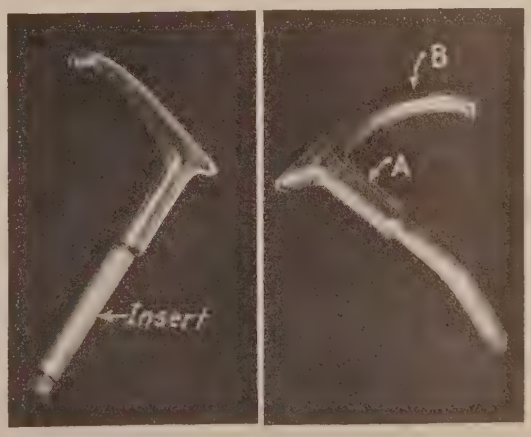

Fig. 10—Chrome-plated Die-Cast Door Handle with Steel Insert

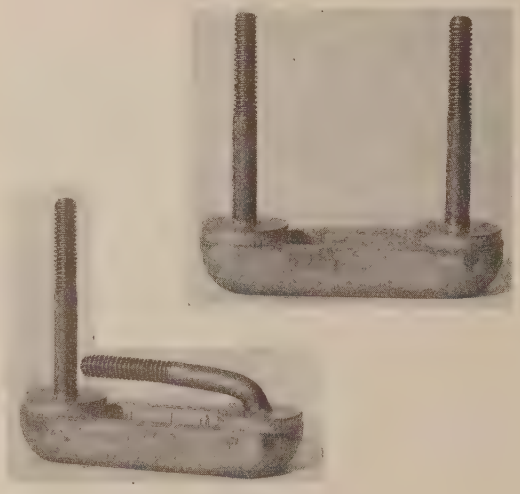
Fig. 10a—Same as No. 13 After Severe Hammering at Points A and B

is a splendid alloy for use in connection with various types of inserts. (See Fig. Nos. 4, 8, 9, 10 and 11.)

The use of inserts is quite general in the die casting industry. These may be of steel, brass, bronze, porcelain, etc. Occasionally another die casting is used as an insert —usually to prevent a soldering operation. Figs. 8 and 9 portray several types of inserts and illustrate the manner in which they are "keyed" into the casting. The shrinkage of the alloy around the insert is just pronounced enough to anchor it so firmly that the casting must actually be broken if the insert is to be removed.

And if the casting is made of a high-grade alloy such as the 4-3-0.1 type, it will not break, as shown by Figs. 11-a and 12-a.

Fig. 10 shows a commercial automobile door handle which has been cast around a steel insert of the type shown in Fig. 11. This door handle was placed in a vise and severely hammered, resulting in appreciable deformation without breaking. (See Fig. 10-a).



Figs. 11 and 11a—Steel Screw Inserts Cast in the 4-3-0.1 Alloy. Figure 14-a represents one of these inserts severely deformed but still firmly anchored in the casting

Another example of the toughness of good zinc base die castings is illustrated by Figs. 11 and 11-a. In this case one of the steel machine screw inserts was hammered flat on the casting without coming loose from its anchorage or without cracking the casting.

Although the employment of inserts will obviously increase the cost of the casting, it is frequently possible to prove an economy in the finished product due to the elimination of machining and assembling costs.

Inserts are used to impart greater strength or elongation at localized points—affording the properties of a wrought structure where a cast structure would not serve satisfactorily. Door handle inserts exemplify this use. They are sometimes used to give hardness or special wearing qualities (Fig. 4), and are also employed to afford the special bearing properties of the bronze alloys. Specific electrical properties pertaining to either resistivity or conductivity may also be had through the use of inserts. Laminated pole pieces may be made an integral part of the casting to be used in the manufacture of electric appliances.

In this connection, the use of zinc-base alloys offers an excellent material which may be given special properties at local points without influencing the general economy afforded by the use of die castings. As a matter of fact, the die casting process is much more versatile in this respect than many other production methods which involve welding, soldering, brazing, or mechanical couplings.

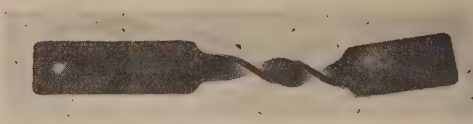


Fig. 12—Tensile Bar Die Cast of the 4-3-0.1 Alloy Twisted Through 360 Deg. Without Fracture

The author is frequently asked to compare the physical properties of zinc-base die castings with castings made of other materials such as brass, bronze, iron and aluminum alloys. Due to the wide variation in the figures given for these materials it is rather difficult to make an accurate comparison.

A study of the various possible sources of available data reveals that the tensile strength of the 4-3-0.1 alloy is at least 24 per cent greater than sand cast brass or bronze, while the impact strength is lower than that of cast brass and about the same as that of cast bronze. Compared with cast iron, the 4-3-0.1 alloy is at least twice as strong with respect to tensile strength, and is greatly superior in impact strength. Sand cast iron has an impact strength of from 2 to 5 ft.-lb. per sq. in., as compared with well over 100 ft.-lb. per sq. in. for the 4-3-0.1 alloy. The toughness and ductility of zinc base alloys are quite well illustrated in Fig. 13 which represents a die cast tensile bar twisted through 360 deg. without fracture.

It is estimated that the production of zinc-base pressure die-castings consumed well over 60,000,000 lb. of high grade zinc in 1928. The consumption for 1929 will exceed that of 1928. New fields are presenting themselves every day. Many complicated parts which were not economically possible with other methods of production are now being made of strong, high-quality zinc-base alloys by the die-casting method.

Fig. 13—This Well-Known Pencil Sharpener Is Made of the 4-3-0.1 Alloy. It was dropped 55 ft. to a concrete floor without any evidence of fracture. It could not be fractured by the application of 21.57 ft.-lb. force, which was the capacity of the testing machine.

High Speed in Cupola Melting

Metallurgical Advantages Are Many—Average Speed in Over 200 Foundries Is Slow—Conception of a Composite Cupola

THAT the economic advantages of melting iron in a cupola at the best speed obtainable are evident to all foundrymen was the contention of W. N. Truxell, research engineer, Potter Coal & Coke Co., Greensburg, Pa., in an address entitled "The Metallurgical Advantage of Higher Melting Speed," delivered at the December meeting of the Philadelphia Foundrymen's Association, Manufacturers Building, Wednesday evening, Dec. 11. The attendance of local foundrymen was large.

In his extemporaneous speech, Mr. Truxell said that the aim of most foundrymen is to melt iron at the cupola's rated speed or better, and he pronounced it his purpose to point out some not so obvious, but none the less real, advantages which follow such practice, properly carried out. His arguments and deductions on melting practice were collected from personal observation of over 200 foundries in Canada and in the United States, east of the Mississippi River.

Average Cupola Operation Only 75 Per Cent

TO begin with, said the speaker, it has been found that the average cupola is operated at approximately 75 per cent of its rated speed, although there are a few which are up to and even higher than the rated speed, while others are considerably below the average. To obtain extremely hot iron it has long been contended that speed necessarily must be reduced. It has certainly been learned that hot iron and rated speed can be obtained readily with the speed even increased.

When iron is melted slowly and at a high temperature, the charging of excessive coke is found to be the usual practice; but this term, excessive coke, requires some explanation. Most foundrymen think of coke weight as in ratio to iron rather than in comparison to air, so that, in the case of excessive coke and slow melting, one finds the hot area in the cupola limited in height and with poor conditions for combustion. Hot iron may be obtained this way, and it is being done quite frequently, although many other factors enter in. It is evident in these circumstances that the iron has quite a period of time and favorable opportunity to undergo changes such as losing silicon and phosphorus and picking up carbon and sulphur. Careful comparisons, however, show that iron melted in this way will vary so greatly from the iron which is charged as to be almost unrecognizable.

Loss and Pick-Up of Elements

WHEN a cupola is melting at capacity speed or better, that is, 10 tons an hour for a 10-ton cupola, and delivering equally hot metal, the difference between the analyses of metal charged and metal poured shows a likeness that encourages the melter in his conviction that he can deliver iron at the spout which will meet specifications. Many foundries are losing 0.20 to 0.25 per cent silicon and phosphorus while picking up 0.10 per cent sulphur as compared to others with a silicon and phosphorus loss of 0.10 per cent and a sulphur absorption of 0.05 per cent. It is rather significant that these figures vary directly with the melting speed.

As to the picking up of carbon, several large foundries are melting a high percentage of steel in an endeavor to obtain high tensile strength, aiming at low total carbon, and are obtaining 3 per cent carbon and under regularly by operating at high speed. It should be sufficient to encourage small foundrymen to at least investigate the possibilities of their own melting equipment when one realizes the high melting speeds maintained by our automobile foundries and the uniformity of their output.

Foundry cupolas and also the method of their operation vary to an almost unbelievable degree. The time is rapidly passing when every foundryman regards his cupola and foundry conditions unique. Today, one realizes that the cupola is no longer "she," but a piece of mechanical equipment, and therefore subject to the same laws of mechanics and physics.

A Composite Cupola Described

DESCRIBING what he termed a composite cupola, Mr. Truxell declared that the composite average of American cupolas today, which are operating economically and efficiently, will be found to conform to the following general description:

> The height of the charging doors from the tuyeres is 13 to 15 ft. This height varies only as the size of the material to be charged and not with the diameter. The cupola which will carry eight charges to the charging door has been found to lie well within these dimensions and to operate ideally as regards blast air pressure, sufficient stock being present to take advantage of the heat generated, and yet not excessive to the point of requiring additional blast pressure to penetrate the mass or to necessitate additional coke to replace fuel loss by premature burning high in the stack.
>
> As regards the tuyeres, our composite cupola has its single continuous tuyeres with a height equal to one-twelfth of the diameter as lined. This height gives a tuyere ratio to the cupola of three to one, which, of course, in turn, gives a low blast pressure. A large majority of foundries are approximating this tuyere condition.
>
> Coming to the crucible or reservoir at the cupola, there is a large variable due primarily to local conditions in jobbing foundries. Our average, however, for an economical cupola melting hot iron is a crucible 12 in. high from sand bottom to tuyere.

In a cupola which conforms to these general specifications, operated with the correct amount of air, the melting zone will be found to extend to approximately 24 in. above the tuyeres with its center lying about 16 in. above them. The height of the melting zone will vary with the kind of coke used. A dense, heavy, slow-burning fuel tends to lower the zone. The ideal coke for fast melting should contain a high total carbon and a high percentage of volatile matter with an open structure. High-volatile properties mean easy ignition, particularly when in conjunction with an open structure permitting easy penetration of air.

River Shipments Gaining Rapidly

Ohio Carries Large Tonnages of Iron and Steel— Gain of 339 Per Cent, 1917 to 1927— One-Sixth Enters Mississippi

IRON and steel shipped on the Ohio River in 1927 accounted for 981,999 net tons out of a total river traffic of 20,128,518 tons, and were the chief commodities having a through movement on that stream. The rapid growth of inland waterways traffic, prominently reflected in the increasing iron and steel movement, is strikingly shown in a report entitled "Transportation in the Mississippi and Ohio Valleys," issued by the Board of Engineers for River and Harbors of the War Department in cooperation with the Bureau of Operations, United States Shipping Board.

The vast bulk of iron and steel tonnage moving by water originates in the Pittsburgh district on the Monongahela and Ohio Rivers, shipments by the Allegheny River being small and declining, dropping to only 9676 tons in 1927 from 55,087 tons in 1924. In contrast with this were the heavy increases in iron and steel tonnage moving by the Monongahela and Ohio Rivers, though that moving by the Monongahela showed a slight dip in 1926 to 571,284 tons from 580,126 tons in 1925.

But the heavy gain in the steel traffic on this river is shown by comparing the figure of 957,278 tons in 1927 with 371,675 tons in 1924. The iron and steel movement by the Ohio, a great proportion of which comes from the Monongahela, was 575,462 tons in 1926, 535,543 tons in 1925 and 550,363 tons in 1924. The total Ohio River traffic in 1925 was 15,737,000 tons and in 1926 it was 19,754,000 tons, duplications being eliminated. The Ohio River traffic made a gain of 339 per cent in 1927 over the 4,600,000 tons of 1917. The traffic on the Ohio River system for 1928, after eliminating all known duplications, was more than 46,000,000 tons, or about 69 per cent of the total of 62,500,000 tons for the entire Mississippi River system.

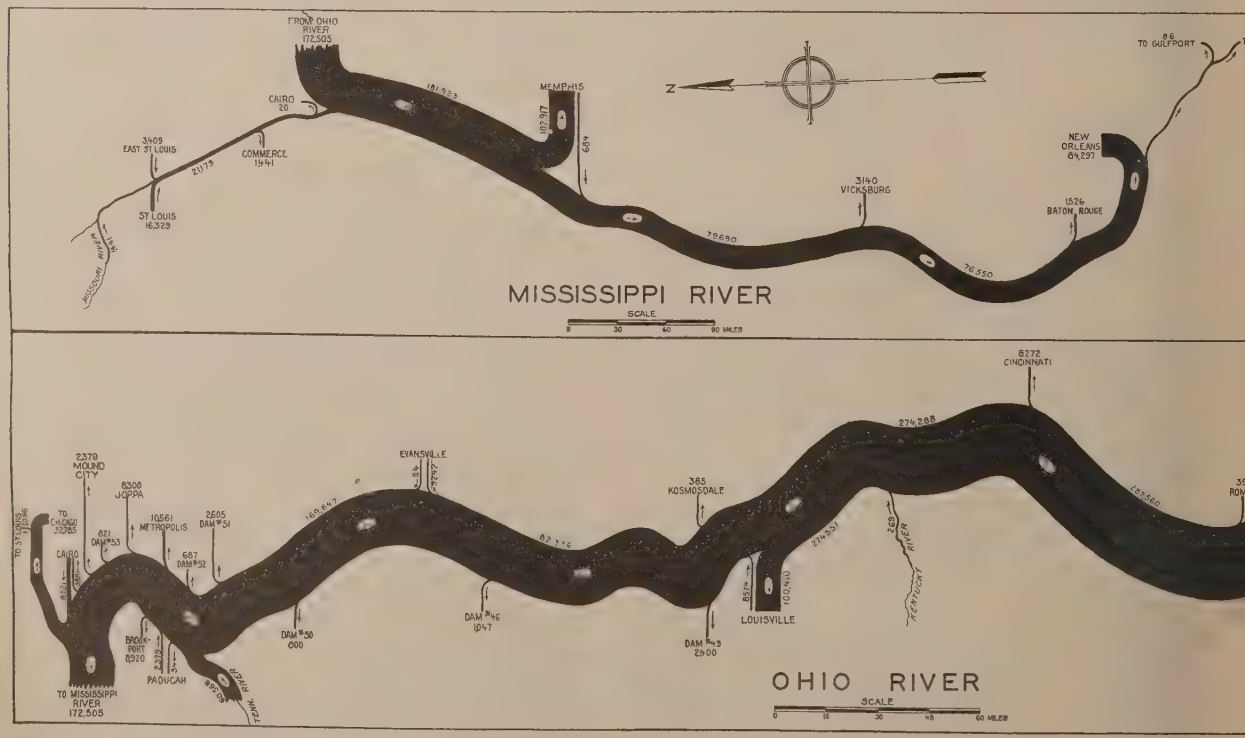
Large Savings in Transportation Costs

With the completion of the canalization project for the Ohio River, the report said, the traffic will undoubtedly make further important gains. The large steel companies, the public service corporations and common carriers are all planning to use the river more intensively. Deducting the fixed charges, including interest on the cost of improvements, operation, care and maintenance charges, the net saving in transportation costs in the ton miles of traffic as carried on the Ohio River in 1925 was found to be $11,387,000.

It was further declared that, during the last 27 years, the Monongahela improvement has paid for itself and has earned a surplus of about $100,000,000, returned to the general wealth of the nation through reduced transportation costs.

Movement Originates Above Pittsburgh

Dealing with the transportation of iron and steel by waterways, the report stated that the large steel corporations in the Pittsburgh district, along the banks of the lower Allegheny, Monongahela and upper Ohio Rivers, have in recent years been shipping large quantities of iron



and steel products to lower Ohio and Mississippi River points as far as New Orleans, a distance of 1959 miles. These products have moved on barges taken from the equipment of their long-established coal transport service on the Monongahela River and converted temporarily to the new use, as well as by covered barges constructed especially for the purpose.

"The use of water routes for shipment of iron and steel products is a natural development resulting from increased foreign and domestic competition," said the report. "The all-rail rates from the Pittsburgh district to the developing markets of the Southwest and the Pacific Coast are unfavorable as compared with rates from nearer plants and from Europe. Low-cost barge transportation, however, enables the plants in the Pittsburgh district to reach the markets of the Southwest, and it supplies an all-water route to the Pacific Coast, supplementing the rail-water route via North Atlantic ports, both of which afford savings, compared with transcontinental rates."

Many Plants Feed into the System

Analyzing the iron and steel movement, the report stated that of the 575,462 tons shipped in 1926 by the Ohio, 216,835 tons moved downstream from plants located on the Monongahela, while lesser amounts were shipped from Woodlawn, Pa., Ironton, Ohio, and points on the Tennessee. The principal receiving points on the Ohio were Ambridge, Pa., 71,197 tons; Bellaire, Ohio, 11,567 tons, and Louisville, 100,410 tons. Of the downstream movement, 193,628 tons passed from the Ohio to the Mississippi. The principal receiving ports on the Mississippi were Memphis, with 102,917 tons, and New Orleans, with 84,297 tons, while smaller quantities were barged to Gulfport, Miss., and Mobile, Ala. A total of 39,854 tons passed from the Ohio to the Mississippi for delivery at St. Louis and Chicago. Of this quantity, 32,785 tons of pig iron went to the latter and 7069 tons to the former.

The upstream movement of iron and steel during 1926 totaled 44,987 tons, according to the report. Shipments were made from New Orleans and Memphis on the Mississippi, while Bellaire, Ohio, with 19,366 tons, and Benwood, W. Va., with 18,864 tons, were the outstanding ports shipping tonnage upstream on the Ohio.

Iron and Steel Products Shipped on Ohio and Mississippi Rivers

(In Net Tons)

River	1927	1926	1925	1924
Monongahela	957,278	571,284	580,126	371,675
Allegheny	9,676	10,927	16,999	55,087
Ohio	981,999	575,462	535,543	550,363
Mississippi:				
Mouth of Missouri to mouth of Ohio	23,479	21,644	20,840	10,045
Cairo to Memphis	292,028	169,603	86,841	42,762
Memphis to Vicksburg	128,214	79,065	46,228	33,917
Vicksburg to New Orleans	133,208	76,023	43,993	32,567

The upper Mississippi was recently utilized by a prominent steel company to forward a barge of steel from its plant on the Ohio to Minneapolis. Another consignment of 2500 tons of pipe was taken from Birmingham by railroad to Memphis and barged to St. Paul and Minneapolis. The use of the rail-and-barge route for the latter shipment, instead of the all-rail route, it was pointed out, resulted in a substantial saving in freight rates to the consignee.

Some of the steel companies utilize the Ohio for interplant movements of semi-fabricated materials. One company, with plant at Charleston, W. Va., on the Kanawha River, moves high-grade tool steel from steel plants in the Pittsburgh district. The greater part of the steel moving from the Ohio to the Mississippi, it was added, consists of steel pipe destined to the Mid-Continent fields.

Character of Floating Equipment

Barges are now generally constructed of steel and the tendency in coal, gravel and steel traffic is to build hulls having a capacity of 800 to 1000 tons. Records of June 30, 1927, show that 60 per cent of the barge capacity in use in the Ohio Valley is in steel barges having a capacity of over 500 tons, 5 per cent in steel barges having a capacity of less than 500 tons each and 35 per cent in wooden barges. Barges for coal, sand, gravel, stone, unmanufactured steel, etc., were said to be of the open type.

Covered barges, it was pointed out, have recently come into use for transporting manufactured steel, cement and miscellaneous freight, while specially constructed tank barges are used for transporting oil and gasoline.

Recent completion by the United States Engineer corps of the canalization project for the Ohio River, comprising 50 locks and dams, provides a year-around 9-ft. channel from Pittsburgh to Cairo, Ill., 968 miles. New projects are mentioned for the inland waterways system. In the summary the report expressed the hope that communities along the Ohio will recognize the importance of constructing suitable terminals to facilitate the development of common carrier service on this river.

"The outlook is for further increase in the use of the Mississippi River system for movement of the products of agriculture, mining and industry, as well as for essential products consumed in the Mississippi basin."

Encouraging Education and Training for Industry

ENGINEERS as a rule give little thought to the young men who are growing up in industry and learning industrial work. Of course, it is fashionable to patronize a young engineer and help him over his early strenuous years. But such patronage is different from an understanding of the need of American industry as a whole for trained young men, and young engineers are quite different from the type of young men who do not graduate from a technical college, but who hope to become mechanics, technicians, draftsmen, or highly trained, highly skilled experts of any kind.

Discussing this question before a recent meeting of the American Society of Mechanical Engineers, Harold S. Falk, vice-president and works manager Falk Corporation, Milwaukee, pointed out that it is no longer possible to hire skilled mechanics at will. In February, 1927, when business was rather dull and 40,000 men were reported to be idle in Milwaukee, a prominent oil-engine manufacturer received a considerable order, and wanted to engage 65 high-grade mechanics. Among all those unemployed men, it was impossible to find the 65 mechanics or anywhere near that many. The employment manager visited other cities in a search for skilled men, but failed to assemble the required number.

A certain foundry managed to get a little business in 1924, which was also a year of business depression, and was unable to engage 18 first-rate foundrymen, although the number of unemployed in the city at the time was as great as ever. Our industries are clearly confronted with the responsibility for training their own mechanics and experts.

At first sight, this may not appear to be a problem of the engineering profession. However, the welfare of the profession depends upon the progress of industry. To this extent, at least, engineers are concerned with these problems of industrial training. Although much has been done in apprenticeship in various centers and individual industries, a mere beginning has been made, and very few manufacturers, comparatively speaking, have given the question much attention.

Designing for Safe Operation

Some fundamentals of design should be embodied in every electrically-propelled overhead carrier put in service. Such a carrier should have the operator's cab supported separately from that part of the carrier which carries the load. The practice sometimes followed, of carrying the operator's cab from the main body of the hoist is to be severely condemned, in the opinion of E. T. Bennington, Cleveland Electric Tramrail, Wickliffe, Ohio, speaking at an engineering meeting in Akron.

It is not uncommon for an operator to try to pick up a load which either is attached to the floor or is held in place by sticking or shifting of piles, with the result that the lifting effort is many times that for which the carrier is designed, and something gives way. If it is a king pin, a wheel pin, load bar or hoist, the operator suspended from the load-carrying member will surely drop with that member. But if he is separately supported on the rail, the rail itself must break before he can be injured. There is then little likelihood of his ever reaching the ground, as the rail is always the strongest member on any monorail system.

Turning With Shallow Cuts at High Speeds

Experiments Include Effect of Composition and Heat Treatment Upon Tool Performance—Drilling Also Discussed at A. S. M. E. Meeting

RESULTS of fundamental studies in the fields of turning and drilling were outstanding features of the cutting of metals session held in connection with the fiftieth annual meeting of the American Society of Mechanical Engineers in New York last week.

The data relating to turning were given in a paper on "Turning with Shallow Cuts at High Speed" by H. J. French, formerly senior metallurgist, Bureau of Standards, now with the research department of the International Nickel Co., Bayonne, N. J., and T. G. Digges, associate metallurgist, Bureau of Standards. The paper on drilling, by O. W. Boston, college of engineering, University of Michigan, and C. J. Oxford, chief engineer, National Twist Drill & Tool Co., Detroit, was on the "Power Required to Drill Cast Iron and Steel." The session at which these papers were presented was held Dec. 3 under the joint auspices of the A.S.M.E. special research committee on cutting metals and the machine shop practice division. A. H. d'Arcambal, Pratt & Whitney Co., Hartford, Conn., was chairman.

The authors of the paper on "Turning with Shallow Cuts at High Speeds" pointed out that most studies of turning have been in connection with relatively coarse feeds and deep cuts. Such studies have made it possible to predict with accuracy sufficient for many practical purposes the cutting speeds that can be used economically in rough turning. But comparable information has not been made available for the shallow cuts used in finishing.

Lathe Tests Made with Two Tools in One Holder

Experiments dealt with in the report relate to a new method of test for lathe tools taking shallow cuts. To give a broad background for useful interpretation of results, the new method was used first in a study of the effects of feed, depth, cutting liquids and tool form upon cutting speed. It was then used in a study of the effect of composition and heat treatment upon the performance of carbon and high-speed steel tools, and the results compared with those obtained in the customary rough-turning tests.

The method of test makes use of two tools set at equal depths in one tool-holder (see Fig. 1) and is based upon the fact that the "trailer" or following tool will not cut so long as the "leader" or cutting tool shows no wear. One of the advantages of this method of test is its simplicity, as the only special equipment required is the tool-holder; another advantage is that there is nothing to interfere with the rigidity of the test tool. For the most part the test tool used had a broad nose and was of the form and dimensions shown in Fig. 2. A round-nose tool

(*Continued on page* 1704)

THE Special Tool Holder (Fig. 1) Used in the Shallow Turning Tests Is of Simple Design. The form and dimensions of the test tool are shown in Fig. 2 and those in the round-nose tool used for the trailer in Fig. 3

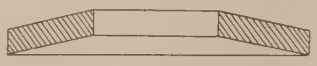
Mechanical-Spring Characteristics

Radially Tapered Disk Springs, Elastic and Inelastic Behavior in Spring Materials and Present Status of the Mechanical-Spring Art

SPRINGS for use in industry were considered somewhat exhaustively at a session of the American Society of Mechanical Engineers, Dec. 3, during the annual convention. Three papers were read and discussed. Much of the material was of a highly technical nature. Such of it as is of general interest is abstracted in the paragraphs below.

Radially tapered disk springs were taken up in a paper by W. A. Brecht and A. M. Wahl of the Westinghouse Electric & Mfg. Co., East Pittsburgh. They showed the advantages of disk springs, both flat and dished, having radially tapered cross-sections. Equations were given for calculating both the strength and the flexibility of these springs. Results of tests, including both strain measurements and deflection, showed the closeness with which practice follows the theory.

Present status of the mechanical-spring art forms the subject of a comprehensive paper by Joseph Kaye Wood, consulting engineer, New York. He traced the principal developments in this country and abroad during the past



Section of Belleville Dished Disk Spring

five years and made suggestions for additional research on points not yet fully established. The paper includes results of the author's continued work on a simplified code of design for mechanical springs.

Elastic and inelastic behavior in spring materials forms the subject of a progress report of the special research committee on mechanical springs. This was presented by M. F. Sayre, supervisory member in charge of research and associate professor of mechanical engineering at Union College, Schenectady, N. Y. He discussed tension tests made on spring metals and called attention to the fact that the elastic line of a metal is apparently curved. This effect is not noticeable at low stresses such as are carried in structural steel, but is observed at the high stresses carried in spring metals. Hysteresis was discussed in connection with changes in the value of the modulus of elasticity in the material.

Radially Tapered Disk Springs

IN ENGINEERING problems the need is frequently felt for a "frictionless" spring where space or other limitations do not permit the use of springs of conventional design, such as the helical spring. For one such application, flat or dished circular disks of spring steel, of uniform thickness, having concentric circular holes, and loaded uniformly at the inner and outer edges, were considered. Such disks could be used singly, or in stacks with suitable spacers to secure the desired flexibility.

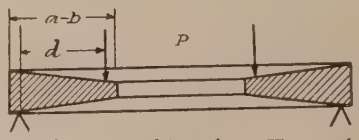
In computing deflections and stresses in these disks, an approximate method suggested by Dr. S. Timoshenko was first used. In this method the deformation is considered to consist purely of a rotation of the section, cross-bending being neglected. This was found to give results practically identical with those given by the elastic-flat-plate theory.

Advantages of Tapered Section

The advantage of the radially tapered section over a disk of uniform thickness lies in the materially increased flexibility that can be secured where space is limited in the direction of load application. A series or stack of radially tapered disks, such as shown, can often be advantageously substituted for helical springs, especially where loads are high and relatively small deflections are required. In such cases the advantages of the radially tapered disk spring may be summarized as follows:

1. The disk spring is adjustable in height and flexibility by adding or taking off disks.
2. It will withstand lateral loading as well as axial loading.
3. It can be so designed that no disk will be overloaded. Failure of one disk will not cause the complete loss of flexibility, nor will it increase the load on the remaining disks. A failure of one disk would not require replacement of the whole spring.
4. Helical springs of large size are difficult to heat treat uniformly—a disadvantage which can be overcome with the disk spring.
5. Disk springs can be designed to occupy very little space in the direction of load application.

Helical springs are the cheaper to manufacture unless production of the disks is high enough to warrant making



Application of Load on Tapered Disk Spring

forging dies. It may be noted that radially tapered disks have been successfully die forged from 0.90 to 1 per cent carbon spring steel so that no machining was required on the disk faces.

Formulas by Approximate Theory

Formulas have been developed for deflection and stress of radially tapered disks using both the approximate theory and the more exact flat-plate theory. The approximate theory is developed both for flat and dished disks. Since the flexibility decreases rapidly with dishing, the formulas in the paper apply to flat disks of radially tapered section only.

Proportions of Springs for Maximum Flexibility

It has been found that in designing a disk for a given load and a given stress the deflection varies with α, or the ratio of the outer radius a to the inner radius b. The

variation of α also produces a change in the thickness constant k.

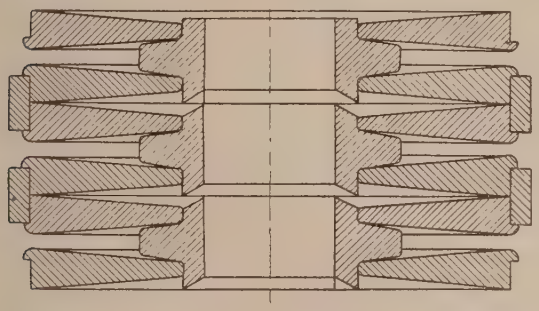
Deflections are a maximum when $\alpha = 2$. It has been found that this maximum always falls somewhere between $\alpha = 1.95$ and $\alpha = 2.05$. This value of α not only gives a maximum deflection, but results in disks of greater lateral stability and of better proportions for forging and heat treating than disks having larger ratios of outer to inner diameter.

Tests on Flat Disk Springs

A series of flat disk springs having various ratios of outer to inner diameter and various values of the thickness constant k were tested. [Test curves were given in the paper, one pair being reproduced here. This pair dealt with springs having outer radius 3.81 in., inner radius 1.5 in., outer thickness 0.267 in. and inner thickness 0.105 in. The springs tested were machined, heat treated and ground.]

Conclusions

Since the stress distribution along a radial section of these disk springs is approximately constant for values of



Stack of Radially Tapered Disks, with Distance Pieces and Keepers

the ratio α of outer to inner diameter less than about 2, it may be said that these springs utilize the material about as efficiently as do transverse elliptic springs (which may be considered as bars under a constant moment). They therefore do not utilize the material quite so efficiently as helical springs; but, on the other hand, have certain advantages over helical springs which may make them preferable for certain applications.

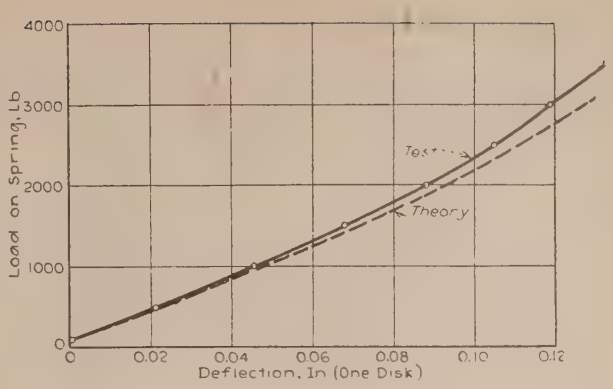
Elastic and Inelastic Behavior in Spring Metals

RESULTS of tests definitely confirm that the modulus of elasticity of a metal is not an absolutely fixed quantity. Overloading in tension beyond the yield point lowers the modulus of elasticity with respect to future lighter loads. Within limits, the greater the permanent elongation, the greater the reduction in modulus. Two weeks' rest at room temperature causes only a slight recovery.

For years Hooke's law, that stress is proportional to strain, has been almost a fixture in engineering practice. Numerical results obtained seem to indicate a second-order correction to this law, not great enough to be perceptible for materials commonly used at low stresses, such as structural steels, but great enough to be noticeable at customary spring stresses in phosphor bronze and spring steel.

Elastic Line Is Curved

With sufficiently accurate measuring instruments, the stress-strain line appears to be continuously curved from zero load upward, not because of minute departures from elastic behavior, but because the elastic line itself is curved. The modulus of elasticity in tension decreases as



Deflection Test on Disk Spring

the load increases, the decrease in slope of the stress-strain line being of the general order of magnitude of 2 to 4 per cent.

From theoretical reasons it is expected that in compression the modulus will increase as the load increases. Work is planned on the much more difficult problem of checking this phase.

The practical effect of this curvature of the stress-strain line upon the stresses in a power or cantilever spring will be to shift the neutral axis toward the compression side, to decrease slightly the maximum stresses on the tension side, and to increase them on the compression side. The magnitude of the effect will be small.

Hysteresis May Prove Troublesome

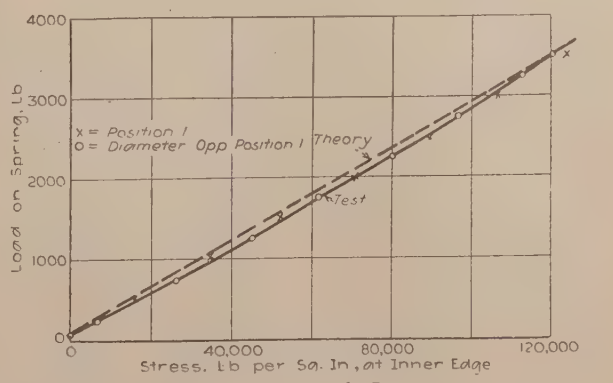
Mention was made last year of a discrepancy in the law of variation of internal friction, or elastic hysteresis, between tension and bending specimens. Later tests have shown that this discrepancy resulted from a sharp break in the law of hysteresis in tension which occurs at about the yield point.

Any overloading, to stresses which exceed 160,000 lb. per sq. in., acts to increase the future energy loss in hysteresis, even for small load ranges. Within limits, the greater the amount of overloading, the greater will be the effect on the hysteresis. Recovery from the effect of the overloading, after two weeks at room temperature, was relatively slight.

The fact that permanent or quasi-permanent changes in both modulus of elasticity and hysteresis begin at about the same unit stress indicates that the two are tied together.

Elongation Effect Negligible

Any permanent elongation of the specimen results in an equivalent decrease of area of cross-section, so that larger elongations would naturally be expected as a result of a given actual load. Any elastic elongation results in



Stress Test on Disk Spring

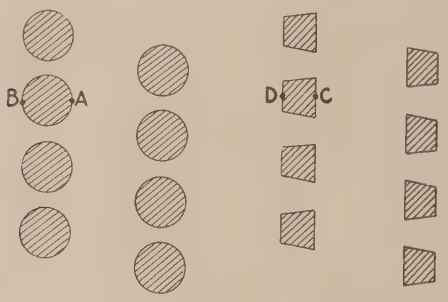
an equivalent elastic decrease in cross-section, but not in the same ratio. The actual amount depends upon the value of Poisson's ratio. It is not felt that this correction properly should be made; it would in any event not be likely to exceed ¼ per cent.

Present Status of the Mechanical-Spring Art

CONSENSUS of opinion in this country appears to be that the mechanical-spring art is not known well enough at this stage to warrant general standardization. Experimental investigation has recently yielded conclusive evidence that the standard stress formula for helical springs can, under certain conditions, be greatly in error. This renders partially obsolete and useless whatever standardization of the helical spring has been accomplished.

Helical Springs

Spring specialists have known for years that helical springs with low index (ratio of coil diameter to wire diameter) are actually stressed considerably beyond the



Stresses at Inner Points A and C Are Double Those on Respective Outer Sides, as B and D

point indicated by the standard formula. To some extent this is due to the fact that the vertical shear, which is neglected in deriving the general formula, becomes appreciable when low indexes are used. Thus, the vertical shear in a helical spring with index 3 is 16 per cent of the torsional shear; with index 8, however, it is only 6 per cent of the torsional shear.

This increase in stress was insufficient to account for breakages occurring in service. Hence, it has been considered good design practice to avoid indexes less than 5 and preferably to keep them above 7. Where space limitations or other factors have required low indexes, the best practice has been to calculate with unusually low stress—a considerably larger factor of safety.

Conical springs were discussed by the writer in connection with a new formula which he had derived. With the ratio of minimum to maximum coil radius increasing to unity, the conical spring approaches and becomes a helical spring.

Oscillatory Characteristics of Springs

Automotive engineers have been bothered with so-called surging or vibrational phenomena on valve springs in poppet valve engines. This comes when the springs get into resonance and vibrate freely in their natural periods at certain speeds within their operating range. This condition is a function of the amplitude of the harmonics of the complete valve-lift curve. Stresses in the spring are considerably greater when surge occurs than those calculated by formulas based upon static conditions.

Investigation of this trouble was reported upon last spring before the Society of Automotive Engineers. Conclusions include:

Low-frequency springs are to be avoided, because, at engine speeds within the driving range, they tend to come into resonance when excited by the lower order of harmonics of the complete valve-lift curve. The lower harmonics usually have appreciable amplitudes.

High-frequency springs are to be desired because, within the same driving range, the resonance points are due to the influence of the higher harmonics, which usually have much less amplitude than the lower harmonics.

Springs with a continuously variable pitch are valuable in minimizing the effects of surge. It is important that a few of the active coils should close up solid when the valve is opened.

Suggestions for Further Work

Several suggestions were made by Mr. Wood as a program for future investigation:

Valve springs—agreement to be reached among outstanding authorities on vibration as to the underlying principles governing the operation of these springs on poppet valve engines.

Helical and conical springs—testing specialists should determine the accuracy of the new deflection formulas for these springs as covered in this paper. This applies also to the special deflection formula derived for springs of variable pitch.

Modulus of elasticity (tensile and torsional)—determination should be made for all spring materials over the full range of sizes and shapes and under all conditions of temperature, heat treatment, cold work and combined stresses.

Continuation of the study of fundamental elastic behavior, particularly as regards the probable slight disruption of Hooke's straight-line law, was recommended. If atomic physicists in cooperation with the spring committee could reproduce in a specially built model the force existing between atoms, then the law of the modulus variation could be determined by test and compared with other observations.

Continuation was recommended of the development of a general code of design on mechanical springs, incorporating all new constants resulting from recent research.

Stresses in Disk and Coil Springs

ONE speaker, in discussing the papers, brought up the question of having disk springs made of rolled material instead of drop forged material, on the theory that this would be more uniform in structure and consequently more reliable in operation. If, then, these springs so made were to be quenched from the inside, it would be possible to transform the residual stress in the material from a hostile stress to one which is friendly. That is, it would provide a stress which in action would partly absorb the operation of the spring.

With regard to coil springs, investigations made by A. M. Wahl of the research laboratory of the Westinghouse Electric & Mfg. Co., East Pittsburgh, have shown that the material is stressed much more heavily on the inside of the coil (*A* on diagram) than on the outside (*B*). For any given load the stress on the inside may be as much as 60 per cent above the average for the whole section, while that on the outside is likely to be 40 per cent below the average. Thus, the ratio of inside to outside on springs of circular cross-section, is about 2½ to 1.

When square sections were bent into coil springs, resulting in final form in a section of trapezoidal character, due to the stretching of the fibers on the outside, approximately the same ratio was found between the inside stress at *C* and the outside stress at *D*, this ratio running from 2 to 2½. It had been supposed that the considerably greater width on the inside would have resulted in a smaller unit stress at that point compared with the unit stress on the narrower outside surface. This, however, was found not to be the case.

Revival of Iron Mining in Normandy

Ancient French Mining Region Develops into One of the World's Largest Iron-Ore Reserves, Capable of Cheap Production and Shipment

BY EDWIN C. ECKEL

FROM the iron trade viewpoint, the most striking result of the World War was the return of German Lorraine to France, thereby bringing under one national control the entire Lorraine ore field. But this change in control did not represent any actual gain to world industry—rather an actual economic loss. It has crippled Germany, which needed the ores and has the coke necessary for their economic utilization; it enriched France to an unnecessary extent, since France must still buy foreign coal to utilize the ores.

Another effect of the war, far less well advertised and probably far more important to the iron trade of the world, is the forced development of the iron field in the Armorican region of northwestern France (the provinces of Normandy, Anjou and Brittany). This is one of the oldest ore fields of the world. The outcrops were worked certainly by the Romans—and probably by the Gauls before them. But their present development, based on a clear knowledge of their geological condition, does not date back much earlier than 1910. Most of the development was forced by the war itself.

Reopening of Ancient Workings

All the older workings were simply shallow open cuts or trenches along the weathered outcrop, 10 to 30 ft. deep and often hundreds of yards long; or else they were equally shallow but broader workings in weathered ore which had become transported some distance from the outcrop and redeposited in small irregular areas. There are literally thousands of these old workings all over northwest France, and in the many centuries they have fed hundreds of small forges, hearths and furnaces.

Today almost all of the active mines are slopes driven in the ore beds to depths which are as yet mostly under 1000 ft., with few exceptions merely fractions of the depths to which workable orebeds are now known to extend. The old open cuts, working on weathered and hydrated brown ore, still furnish a fraction of the total output, serving somewhat as balance wheels; when demand falls off, the open cuts shut down.

In their original unweathered state the Armorican iron ores are hematites and carbonates, altered in some large areas into magnetites. They occur as original sedimentary beds, like the iron ores of Birmingham and Wabana, and, like the latter, they occur in rocks of Ordovician age.

The workable beds average from five to eight feet in thickness; reported thicknesses of 20 ft. are found to include a good deal of slate. Being sedimentary, these ores can be followed down the slope as far as mining is

BOOK REVIEWS

Why Protection for Steel?

The Tariff on Iron and Steel. By Abraham Berglund and Philip G. Wright. 240 pages, 5 x 7¼ in. Published by the Institute of Economics of the Brookings Institution, Washington, D. C. Price $3.

There have been other attempts to tell the truth about iron and steel tariff schedules, but it is to be doubted if any has been so successful as this one. So used are we to politically partisan, sectional or other varieties of prejudice in tariff discussions that the fairness of what these authors have set down seems well-nigh millenial. By none should such a book have a better reading than by members of Congress; but nowhere would this reasoned, informed and unprejudiced putting of the tariff situation in respect to the chief of our manufacturing industries have less weight, judging from the way in which the pending bill has been bedeviled, than with the Congress now sitting at Washington.

Doctor Berglund made a special study of iron and steel when he was with the United States Tariff Commission some years ago, and did a good piece of work in war time and later, on the place of the ferroalloys and their ores in the economy of the steel industry, particularly in their relation to national defense. In the book before us he deals, in the first four chapters, with the various forms of iron and steel, the processes of manufacture, the building up of the industry in the United States, and the position of this country in competition with the steel-producing countries of Europe. With respect to natural resources for the production of iron and steel he shows that the United States leads the world. On the other hand, in respect to natural resources for the production of the ferroalloys (which were the main matter of contention in the making of the metal schedule of the tariff act of 1922, just as they are at Washington today) he finds that the United States is in no such position of unqualified leadership.

The authors have shown due discernment in sifting the propaganda material on manganese and other ores of ferroalloys that for so long has been doing duty in all the committee-room discussions of House and Senate. As might have been expected, they were much less impressed by much of it than were members of the sectional coalition who finally wrote the manganese section of the Senate bill. In dealing with the interests that were successful in getting the ferroalloy paragraphs of the tariff act of 1922 to their liking, they show that the pressure brought to bear on Congress for increased duties on ferroalloys and their ores was much stronger than that for increased duties on iron and steel tonnage products. They also bring out clearly the coalition between the Western producers of manganese, molybdenum and tungsten-bearing ores and the "agricultural bloc," which succeeded in writing into the bill high rates on these minerals which were mainly consumed by manufacturing concerns in the East.

In their final chapter the authors present their conclusions in the form of answers to several questions, including these: To what extent has the iron and steel industry prospered by reason of the tariff? Are iron and steel duties a burden on industrial or final consumers? What is to be said of these duties from the standpoint of public policy? In brief, the answers come to about this:

> 1. While the tariff was formerly helpful in placing the iron and steel industry on a solid foundation, now, so far as tonnage products are concerned, it has served its purpose. The industry is able to meet foreign competition on even terms without artificial aid. Except, perhaps, in the case of certain seaboard furnaces, the duties are nominal. They do not appreciably benefit the industry nor burden consumers. Their removal would cause little or no disturbance.
>
> 2. The duties on alloy ores are a burden to the industry as a whole and to final consumers. There is no prospect that these duties will develop strong industries. Public policy would seem to indicate their repeal.
>
> 3. On the other hand, duties on high grade carbon steel and on the ferroalloys have developed strong domestic industries. So long as protection remains the dominant note in our tariff policy, moderate duties, sufficient to maintain the more efficient domestic producers, have much to commend them.

There will be dissent from the view expressed in the first of the above three paragraphs, that the very moderate duties now imposed on tonnage iron and steel products may be dispensed with. The authors admit that the placing of all tonnage products on the free list "might compel certain branches of it located near the seaboard either to go out of business" [as though that were inconsequential] "or adopt more effective methods." The fact is that the methods of our seaboard works on both coasts are highly effective, yet there is a steady, even though not large, seepage of foreign finished material through seaboard ports. As has been suggested in these columns in previous discussions of this subject, the moderate steel prices prevailing in this market give our manufacturers a considerably smaller rate of profit than is enjoyed by most of our manufacturers who are buyers of steel. With one-sixteenth of the world's population, the United States produces one-half of the world's steel. The producers of the other half may well be satisfied to sell their steel to the fifteen-sixteenths of the world's people, without asking free entry to this market for the products of their low-wage labor.

Concerning the duties on tungsten and manganese ores it is stated that in order to be of any service to domestic producers they had to be high enough to double or treble the price of the imported product. Meanwhile imports, in the case of manganese ore, are six times the domestic production. Conservation of the small supplies we have is urged, against a need that may develop in the future. "The duties on these ores can be defended only on the theory that it is the Government's duty to cherish all its 'war babies' at any national cost. If it is felt that the men who risked their capital in these enterprises in time of national stress have a claim for consideration, it would be far better economy to reimburse them for their investment—buy them out once for all and have done with it."

Several appendices to the book deal with assembling and production costs of various iron and steel products in the United States and the countries of Europe. Some of the data are taken from two articles prepared for THE IRON AGE in 1927 by Paul M. Tyler, formerly on the staff of the Tariff Commission and later with the Bureau of Mines, on dealing with "Transportation Handicaps in Steel" and the other with "Ore and Fuel Costs, Here and Abroad."

A. I. F.

Reducing Management to Formula

Production Planning—Its Engineering Elements. By John W. Hallock. 172 pages, 6 x 8½ in., 64 figures, 3 tables. Ronald Press Co., New York. Price $4.

This volume, by the head of the industrial engineering department of the University of Pittsburgh, is intended to serve both as a textbook in engineering colleges and as an organized reference for manufacturing executives. The organization and direction of production is regarded as a technical engineering subject, and in this book is given the scientific and mathematical treatment universally adopted in dealing with problems of engineering design. The author aims to show how to use mathematical relationship and computations in answering practical questions and solving every-day production problems. Application of the principles and methods of planning are illustrated in connection with the manufacture of globe and gate valves.

From an outline of the function of planning, in which it is recognized that not all plants require the same refinements of planning and production control, the author passes to methods of estimating the time required to perform any given operation in the foundry and machine shop. Relation between power and the amount of metal removed (or machine analysis) includes lathes, milling machines and drill presses; computation of process time is conveniently done by the straight line or alignment chart. Economies in the use of jigs and fixtures is discussed and includes the formulas of Prof. Joseph W. Roe. A chapter on materials handling in controlled production includes the general formulas presented in 1925 by the materials handling division to the American Society of Mechanical Engineers. R. E. M.

Cost Accounting, American and German

Manufacturing Costs and Accounts. By A. Hamilton Church. 516 pages, 6¼ x 9¼ in., illustrated. McGraw-Hill Book Co., Inc., New York. Price $6.

This treatise on cost accounting is intended primarily for the student of accounting, but it seems evident that to receive the full measure of benefit the reader should have a good knowledge of accounting fundamentals, general methods and economics.

While the specific illustrations are based on the fabrication and assembly of finished products in a metal-working shop, the principles laid down and the methods described are applicable to general manufacturing and assembly. The approach and discussion throughout are analytical. The principle that all expenditure that does not contribute in some definite way to the alteration of the status or condition of material is wasted expenditure, is consistently carried in the mind of the author.

The author defines three principal types or methods:

Method A. Direct labor and expense are merged and averaged and charged to each unit of production on a time basis.

Method B. Direct labor is charged to unit quantity on a time basis, while expense is averaged and charged as a percentage on direct wages.

Method C. Direct labor is charged to unit quantity, and expense is similarly charged by means of a machine rate, both on a time basis.

In analyzing the three methods, diagrams, forms and specific examples are given with clearness and painstaking care. Diagrams are somewhat unusual. Emphasis is laid on "work in progress" and its effect on exact costs. The author here indicates that the value of intricate detail is very high to those responsible for manufacturing operations.

In summarizing the results, the author points out that the series of forms set up serve as abstracts of the various transactions treated. The principle is enunciated that all accounting is based on the difference between ownership and property.

To apply these methods to any industry a good grasp of the way in which values are analyzed and combined is necessary. Besides the actual materials bought, stored, accounted for and charged, depreciation, service (such as rent, taxes and insurance), labor and other expense, must be given due weight by a proper mechanism of assembly.

Part III relates to factory returns. Briefly, these are for three sets of officials in a factory, viz:—the foremen, the superintendents and the executives. For the foremen the reports should be prepared by the accountant in detail and each day, for the superintendents, there should be less detail and more comparison; for the executives, even more general and less frequent, consisting, in a word, of the financial results in brief. T. W. Buxton.

Russia Makes a New Start

The Soviet Union Looks Ahead. The Five-Year Plan for Economic Construction. 275 pages, 5⅛ x 7¾ in., with 2 colored maps and 13 charts included in text. Horace Liveright, New York. Price $2.50.

Industrial and agricultural expansion to the extent of $32,300,000,000 in the brief period of five years is so ambitious as to stir our admiration, even though possibility of complete realization appears decidedly remote. Yet such a plan was adopted last May by the 3000 members of the Congress of Soviets, representing more than 180 nationalities.

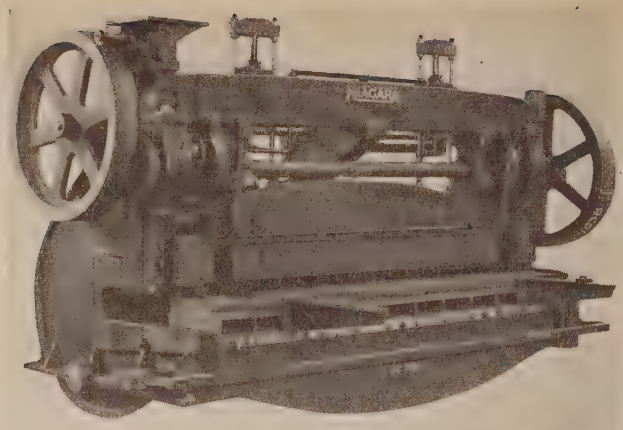
To quote the English version of the five-year plan, "the object must be, with the aid of the colossal natural resources of the Soviet Union, the advantages afforded by its system of an organized and planned national economy and the latest technical achievements, to secure a rate of economic development higher than that yet attained by modern capitalist countries."

Some hint of the problems faced by the Soviet Union with an obstinate peasantry not yet convinced of the advantage of communistic enterprise appears in the distribution of the planned expenditure; half of the 64,600,000,000 rubles will be devoted to agriculture by aiding cooperatives, furnishing tractors and other mechanical equipment and establishing state owned farms, so that by the end of the period the Government will occupy a more important agricultural position than at present. It is planned to have 75 per cent of the agricultural output in 1933 from private farms and 25 per cent from Government and cooperatives of the smaller peasants.

The remainder of the total expenditure is to be distributed to industry and housing, 20,300,000,000 rubles (a ruble is about 50c.); electrification (not including industrial power plants), 31,100,000,000; and transportation, 10,000,000,000.

The problem of obtaining an adequate force of engineers, technically trained workers and generally skilled workmen is acknowledged as the most difficult of solution. It is frankly admitted that the "principal defect in the long-term planning thus far done in the Soviet Union was the failure to give due attention to this problem of personnel, and to assign to it a proper place among the primary requisites." To execute this ambitious program 24,200 additional engineers will be needed by the end of the period in all departments, while the existing higher technical institutions as they now function can supply only about 20,000 for all fields, including transportation, commerce and teaching. It is consequently proposed to provide intensive instruction in certain special fields in-

(*Continued on page* 1706)



The Main Eccentric Shaft of This Squaring Shear Is an Accurately Ground Forging. The eccentrics are forged solid with the shaft

Improved Heavy-Duty Power Squaring Shear

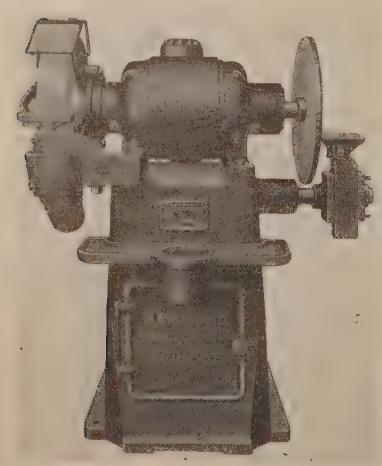
IMPROVED series M heavy-duty mill squaring shears, which range in capacity from ½ in. to ¾ in., mild steel plate, and in length from 60 in. to 192 in., have been announced by the Niagara Machine & Tool Works, Buffalo.

The main eccentric shaft is a large diameter steel forging accurately ground, with the eccentrics forged solid with the shaft. The main bearings in the housings and the rigid center bearings lie immediately adjacent on either side of the eccentrics and holddown cams, an arrangement intended to eliminate vibration, resists deflection and minimize bending stress. The two end bearings are solid sleeves fitted into the housings and may be removed conveniently when worn. The company's patented individual spring foot holddown employed is operated by two cams located on the main shaft. Cam rollers are of hardened steel and run in oil. Toggle links transmit the holddown pressure directly to the housings, relieving the cams, mainshaft and main shaft bearings. Each foot has an individual spring cushion, making it self adjusting for short and long plates of different thicknesses.

The massive crosshead carrying the upper knife is of deep box section, It is counterbalanced by means of two pneumatic cylinders mounted on the crown, but provision is made for counterbalancing by springs or weights if air is not available. The lower knife chuck, of box construction, is adjustable from front to back for the setting of the knives. A large positive jaw clutch with three engaging surfaces controls the motion of the crosshead. All machines of the M series are double geared, the gears having cut teeth. Either belt or geared motor drive may be applied.

Combination Disk and Production Grinder

WHEN disk grinding operations are limited, the solid wheel of the combination grinder illustrated can be used for grinding tools and castings. The machine is a recent addition to the line of the Hammond Machinery Builders, Inc., Kalamazoo, Mich., and is built in four sizes, 2, 3, 5 and 7½-hp. capacity, for 220 and 440-volt, 25 to 60-cycles alternating current, and 110 and 220-volt direct current. Standard equipment includes a steel adjustable wheel guard, steel disk, and plain table, although a universal lever-feed table can be furnished if desired. The machines can also be fitted with disk on both ends, with either the plain or universal lever-feed tables.



The motor is entirely inclosed and is fitted with an air cleaner (patent applied for) which supplies clean air to the windings. The machines are equipped with push button control and automatic motor starter, having thermal overload protection, low voltage, and phase failure protection. The automatic starter, mounted on the inside of the pedestal door is accessible for inspection and resetting. Ball bearings designed to take both radial and lateral thrust are used; they are completely inclosed and protected from dust and grit by double labyrinth seals. Oil reservoirs are provided with convenient oil cups, oil level gage and drain plug for ease of flushing the bearing chamber. The oil chamber is designed so that surplus oil will run out through overflow located at the wheel end of the bearing compartment, away from the motor windings.

The disks are machined on both sides so that two disk wheels can be mounted at one time. After one is worn, the disk can be reversed. Wheel presses for mounting disks can be supplied to order.

Bench Vise Designed to Hold Irregular Shapes

BENCH-TYPE Berjo vises in both plain and swivel-base models are being manufactured by the Avey Drilling Machine Co., Cincinnati. As indicated in the description of the machine vise in THE IRON AGE of Jan. 10, Berjo vises have multiple

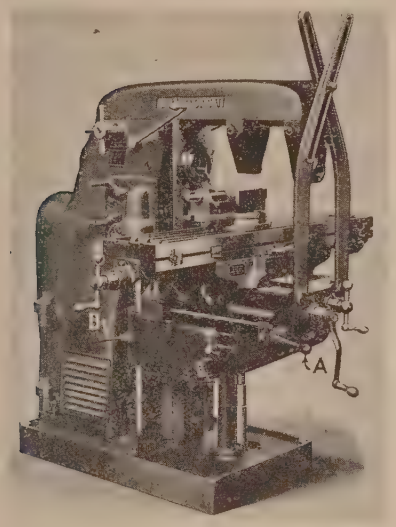
compensting jaws which hold both regular and irregular shaped pieces securely. The jaws are backed by an arrangement of steel balls which flow much the same as a fluid and allow the jaws to follow the contour of the work. The lever at the side is for bringing the compensating jaws into parallel alinement in which position they can be locked. The weight of the plain bench vise is 84 lb. and of the swivel vise 96 lb. The opening is 4 x 7 x 3 in.

Automobile Executives Are Le Blond's Guests

More than 30 executives of automobile factories were guests of the R. K. Le Blond Machine Tool Co., Cincinnati, Dec. 10 and 11, at a special showing of the latest models of Le Blond crankshaft lathes in operation. On Tuesday evening, Dec. 10, the visiting executives were dinner guests of the Le Blond company at the Alms Hotel. W. F. Groene, vice-president, spoke on "The Story of the Crankshaft," tracing the history and development of the crankshaft and the evolution of equipment for manufacturing it.

Millers Equipped with Power Quick Traverse

POWER quick traverse up and down, in and out, left and right, are now provided on the M-type milling machines, Nos. 1 and 2 plain, universal and vertical styles, manu-



factured by the Cincinnati Milling Machine Co., Cincinnati. The rates are 100 in. longitudinal, 66 in. cross and 33 in. vertical.

The power quick traverse lever *A*, which is conveniently located at the left front side of the knee, has three positions: Upward, for power quick traverse; horizontal, for neutral; and downward, for feed. To obtain power quick traverse in a given direction it is only necessary to engage the respective feed lever, move the reversing lever into position and then pull upward on the power quick traverse lever.

Feed in the same direction as the power quick traverse is obtained by moving the lever *A* into the downward or feed position. A detent is provided for holding it into position. Twelve feeds are available; that is, ¾ to 30 in. longitudinal, ½ to 20 in. cross and ¼ to 10 in. vertical, in both directions. Rear control of any one of the three feeds can also be obtained by the use of the rear reversing lever *B*, a duplication of the lever at the front of the feed box.

Pneumatic Wrench to Take Off Staybolt Caps

THE Independent Pneumatic Tool Co., 600 West Jackson Boulevard, Chicago, has brought out a new pneumatic wrench, designated as the Thor No. 278, which operates at 170 r.p.m. The speed is governor controlled. Heavy-duty ball bearings are used at vital points, and a renewable rotor liner is provided to save cylinder wear and reduce upkeep costs.

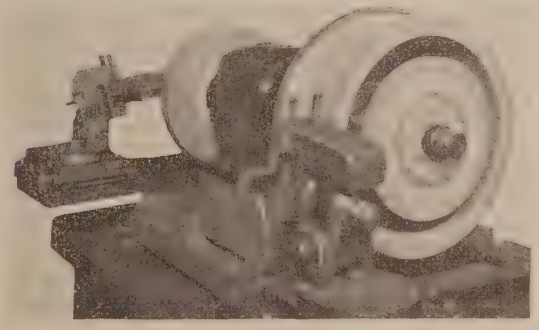
It is claimed that in one shop using this machine the 600 to 750 flexible staybolt caps usually used on locomotives are removed in 6 hr. with only one boiler maker and a helper. Previously, removing these caps by hand required two boilermakers and two helpers working 8 hr. The wrench can be used for removing rusted staybolt caps, and because of its fast starting torque it will break nuts loose from cylinder studs without backing the stud out. Dome nuts, superheater units and frame bolts are also handled rapidly. The tool weighs 40 lb.

Grinds and Laps Tungsten-Carbide Tools

TUNGSTEN-CARBIDE tools may be rough and finish ground and lapped in one set-up in the vise of the combination grinding and lapping machine illustrated, which has been brought out by the Advance Diamond Tool Co., 427 West Congress Street, Detroit.

At one end of the machine there are two rim wheels, one of which is a 12-in. 60-I grit roughing wheel and the other an 8-in. 120-I grit finishing wheel, while at the opposite end there is a diamond lapping disk. Both ends of the machine are provided with a slide that extends across the face of the wheels, and there is another slide which moves toward the face of the wheel. The latter carries a special universal vise.

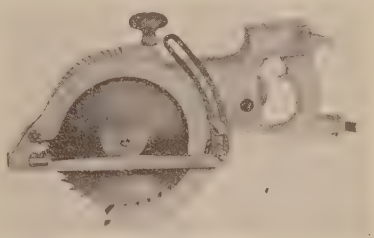
The tool to be ground is put in the universal vise, and the angles are adjusted to requirements. Grinding is accomplished by operating the slide across the face of the rim-type roughing wheel, and then across the finishing wheel. If diamond lapping is to be performed on the same tool the cross slide and universal vise with tool mounted thereon are removed and placed on the slide at the lapping end of the machine. The tool is then moved up against the lapping disk and finish lapped. The tool remains set up to the proper angle throughout the entire grinding and lapping operation. An electric rheostat permits varying the grinding speed to compensate for variations in the hardness of the emery wheels employed. This feature is important in grinding tungsten-carbide tools for the reason that unless the speed is correct, either the wheel does not cut at all or the tool wears the emery wheel away. The machine is said to prove economical in manufacturing plants using as few as a dozen tungsten-carbide tools.



THE Wheels in the Foreground Are for Rough and Finish Grinding of the Tungsten-Carbide Tools. The tool remains set up at the proper angle throughout the grinding and lapping operations

Light Weight Electric Saw

A PORTABLE electric hand-saw weighing 15 lb., for use in shipping departments, plant maintenance and other work, has been added to the



line of the Wodack Tool Corporation, 4627 West Huron Street, Chicago.

This machine, named the Junior model K, is designed for cutting boards up to 2⅝-in. thick. It is compact and has a saw-dust blower that facilitates sawing to a line, a convenient trigger switch, momentary contact, rip gage to save marking the board to be sawed, and a depth gage that is adjusted by one wing nut. Accessories include extension cord, lubricant, grease gun, and a steel carrying case.

An exhibit of silent chain drive in many phases of industrial application will be shown by the Morse Chain Co., Ithaca, N. Y., at the Road Show in Atlantic City, N. J., Jan. 11 to 17. This is substantially the same exhibit as was shown during the Power Show in New York early in December. Flexible couplings, single, double and triple-reduction speed reducers and ring and disk oilers will be featured, as well as the silent chain.

Committee Named to Stabilize Business

Business Leaders Appointed by Julius Barnes, Who Says Reports Indicate No Cause for Timidity

WASHINGTON, Dec. 17.—Courses of action looking to continued stabilization of business probably will be recommended at the first meeting of the 21 members of the executive committee whose appointment was authorized at the National Business Survey Conference held here at the Chamber of Commerce of the United States on Dec. 5. Julius Barnes, who announced the committee, will, as requested by the conference, act as its chairman. The committee is made up of prominent business leaders throughout the country. The steel industry is represented by Myron Taylor, chairman of the finance committee, United States Steel Corporation.

The conference also authorized the appointment of a larger general committee, to be named later. This committee will be broadly representative of the many lines of business enterprise and may consist of as many as 50 men, according to an announcement of the chamber. The individual members of the larger committee will serve as points of contact between the executive committee and trade associations and commercial groups.

Mr. Barnes said that the executive committee will be called into consultation at an early date but that nothing of an emergency character exists in the present business situation to require undue haste in its work. This committee will go over the reports submitted at the conference as well as other material which is being gathered on the business situation, and from these analyses it is expected to recommend a program to be followed for maintenance of business activity and employment.

No Cause for Timidity

Mr. Barnes said that a preliminary study of the many reports submitted to the conference indicates that there is nothing to cause further timidity or hesitation. On the contrary, these reports, he said, warrant confidence in the early stabilization of business activity.

He said that provisions for study and comparison of conditions in the various industries through representative trade organizations is being made by the formation of a large committee comprising competent and recognized leadership in the more important business fields.

The executive committee was made small in number, it was stated, so that it can meet more frequently and act with greater dispatch in shaping and directing major policies. In selecting the executive committee, Mr. Barnes said, it was necessary to choose from a wealth of proved leadership, ability and character. It was recognized that it was impossible to include many outstanding men of tried experience and judgment or to include representatives of every line of business, many of which are of great importance. Geographical distribution was taken into account in choosing the smaller committee, Mr. Barnes explained, but greater weight was given to breadth of experience.

The membership of the executive committee follows: Julius Barnes, chairman, board of directors, Chamber of Commerce of the United States, chairman; Owen D. Young, chairman of the board, General Electric Co. and Radio Corporation of America, New York; Myron C. Taylor, chairman of the finance committee, United States Steel Corporation, New York; Thomas W. Lamont, partner, J. P. Morgan & Co., New York; Paul Shoup, president, Southern Pacific Co., San Francisco; Clarence M. Woolley, chairman of the board, American Radiator & Standard Sanitary Corporation, New York; Henry M. Robinson, president, Los Angeles-First National Trust and Savings Bank, Los Angeles; Walter C. Teagle, president, Standard Oil Co. of New Jersey, New York; James Simpson, president, Marshall Field & Co., Chicago; Cornelius F. Kelley, president, Anaconda Copper Mining Co., New York; Elbert L. Carpenter, president, National Lumber Manufacturers' Association, Minneapolis; Pierre S. duPont, chairman of the board, E. I. duPont de Nemours & Co., Wilmington, Del.; Lewis E. Pierson, chairman of the board, Irving Trust Co., New York; George Horace Lorimer, editor, *Saturday Evening Post*, Philadelphia; Walter S. Gifford, president, American Telephone & Telegraph Co. New York; Alvan Macauley, president, National Automobile Chamber of Commerce, Detroit; John G. Lonsdale, president, American Bankers Association, St. Louis; Stuart W. Cramer, director, Cotton Textile Institute, Cramerton, N. C.; Charles Cheney, president, National Industrial Conference Board, Manchester, Conn.; Silas H. Strawn, chairman of the board Montgomery Ward & Co., Chicago; Harry Chandler, publisher, *Los Angeles Times*, Los Angeles.

Machine Tool Trade Hopeful

The chamber has prepared summaries of reports submitted to the conference and distributed them in booklet form.

The report for the machine tool industry was filed with the chamber by E. F. DuBrul, Cincinnati, general manager, National Machine Tool Builders' Association, who pointed out that the first 10 months of 1929 produced about one-third more business than was booked in the first 10 months of 1928. During all of 1928 the orders were on the upgrade, the report said, but in 1929 orders have been on the downgrade since May, which was the peak month for the present movement.

"It seems reasonable to expect that 1930 should turn in between 20 and 25 per cent less orders for machine tools than were booked in 1929," it was declared. "This would be only a little below 1928, which was a good, comfortable year for the industry. Since we had to run overtime and even double-shift to make deliveries in 1929, we feel that we shall be quite comfortably off on a year's business that would be only 75 per cent of the volume of such a boom as we have been in."

Crane Builders Expect Good Business

Reporting for the electric crane industry, President W. D. Sayle of the Electric Overhead Crane Institute said:

"We are just completing a most satisfactory business year, as is indicated by the fact that the shipments of electric overhead cranes for the first 10 months of 1929 exceeded the shipments for the same period of 1928 by over 68 per cent. The orders received for cranes during the first 10 months of 1929 exceeded those received during the same period of 1928 by over 97 per cent and exceeded the orders for the entire year of 1928 by 65 per cent.

"It is quite evident from the foregoing that the balance of orders at this time, and of which there is not the slightest evidence of cancellation, will provide a volume of business for the year 1930 fully equal to that of 1929, even should there be a slight falling off in the volume of new orders during the early part of the year 1930.

"It was the consensus of the industry that, while there might be a moderate cessation in the placing of new orders for cranes, there would be a quick recovery from such depression, if it occurred, and that the total volume of new crane business placed in 1930 would undoubtedly be fully equal to that of 1929."

Look for Upturn by March

The condition and prospects of the woodworking machinery industry were stated in a report filed by L. P. Monks, president, Association of Manufacturers of Wood Working Machinery. It was pointed out that during the closing period of 1928 the industry was on an upward curve and that the closing of 1929 shows it to be on a downward curve. The report said that the industry scarcely expects to note a decided improvement before March, 1930, although it is "quite confident that we shall swing into an upturn by that time."

The present situation in the forging industry was declared to be slightly off from this time last year, said a report filed on behalf of that industry by G. H. Weiler, New York. Prospects for the next six months, as compared with a corresponding period this year, it was added, are nearly equal. The report represented about 85 per cent of the industry.

Is Business Taking Course of 11 Years Ago?

Then, as Now, Output of Basic Materials Fell Off More Than Retail Trade—Post-Armistice Curtailment of Consumer Buying Failed to Materialize

BY DR. CHARLES O. HARDY

THE outlook for business in 1930 is but little clearer than it was a month ago. The recession of business activity which was in evidence before the stock market collapse is proving to be very irregular in its incidence, some lines of activity falling off with amazing rapidity while others show little sign of slackening. It is quite remarkable, for instance, that steel production has shown the most rapid decline on record, while coal production has not fallen below normal; cotton consumption has been extremely slow, while chain store and mail order sales continue their rapid rate of growth. The situation is confusing.

The favorable factors may be summarized as an unexpected strength in retail trade, a farm situation distinctly better than in most recent years, an ample supply of credit, moderate inventories and, finally, a well-organized movement headed aggressively by the President of the United States to stabilize the business situation by stimulating those lines of activity where output need not be adjusted to temporary fluctuations in demand.

The outstanding unfavorable factors are a widespread undercurrent of pessimism, engendered by the stock market collapse, and the accumulation of evidence that the actual rate of operation in several basic lines has been falling off with a rapidity which reminds one of the behavior of the stock market itself.

Of the two unfavorable factors mentioned the psychological situation is the more difficult of description. Naturally the optimists are more outspoken and receive greater publicity than do the pessimists; nevertheless there is an undercurrent of gloom which is not dissipated by the expressions of confidence that have emanated so generally from public officials, business and financial leaders and business forecasters.

Basic Production Shows Sharp Drop

THESE apprehensions were confirmed by the reports of basic production for November. The worst report was from steel—a drop in the daily rate of production, from October to November, of 19 per cent, the largest on record. Moreover, this was the sixth successive month which showed a decline. Pig iron output also, of course, fell off sharply, though the reduction was not so great and the November rate was higher than that in any month in the last half of 1927.

The report of unfilled orders of the United States Steel Corporation, on the other hand, showed an increase for the third successive month. This showing was due to the fact that production was cut in November to 75 per cent of capacity as compared with 85 per cent in the preceding month, while bookings fell only to 78 per cent of capacity as compared with 98 per cent in October. In spite of the substantial backlog of unfilled orders the Steel Corporation's rate of activity has continued to decline, and was reported at 65 per cent on Dec. 14.

¶ Public works and utility programs have previously expanded in slack times.

* * *

¶ Now central organization and planning will reinforce stimulus of savings in cost.

* * *

¶ Present juncture recalls business situation after Armistice. The stock market declined sharply in November, 1918, commodity prices turned downward, industrial activity slackened.

* * *

¶ Then, as now, the center of depression was in parts of the industrial organism furthest from the ultimate consumer. But the buying power of consumers was underestimated.

Cotton consumption in November was off 18 per cent from October and 14 per cent from November of last year. Stocks of copper and of raw silk are reported as heavy and increasing, and prices of raw materials generally have been falling except in cases where producers are so well organized that they can hold up prices in the face of slack demand.

Retail Trade Is Sustained

Wholesale trade is generally reported as bad. On the other hand, the slump in retail buying which was feared as the immediate result of the stock market collapse has failed to materialize. Sales of 26 leading chain store companies for November (including those of the two leading mail order houses) showed a gain of 15 per cent over last year. Nor does this mean merely that buyers have turned from the higher priced stores as a forced measure of economy. Reports of department stores and other retailers to the various Federal Reserve banks are generally good; it appears now that Christmas trade will be very satisfactory. Sales of radios, automobiles and a few other "luxury" lines show up badly; it is uncertain how far that reflects over-selling during the past year and how far it is a result of speculative losses.

The most interesting development of the month is the series of conferences called by the President to encourage the carrying forward of construction activities. It has often been suggested that the most hopeful way to deal with business depressions is through organized effort to concentrate in such periods the building of roads and school houses, the improvement of rivers and harbors and other public works, together with railroad and public utility construction and such industrial expansion as does not depend for its justification upon the immediate state of the market. On the other hand, so the theory runs, in periods of high industrial and commercial activity a sound policy calls for the curtailment of construction of the types just indicated. Such a plan has the double advantage that it would result in an economy of construction and financial cost and would tend to equalize the volume of employment and the disbursement of purchasing power.

Stabilizing Influence of Public Works in Previous Years

TO a certain extent the plan has been carried out heretofore, public works and public utility operations tending to expand in slack times and giving way to industry when the pressure is great. Thus railroad, public utility and State and local borrowings were nearly twice as great in 1921 as in 1919; their combined total was larger in the dull year 1924 than in either 1923 or 1925. To carry out the idea effectively, however, requires central organization and planning, in addition to the stimulus of an uncertain saving in cost.

The notion that the Federal Gov-

ernment can play an important role in bringing about such a balancing of economic activity is relatively new in practical politics, and is one of President Hoover's titles to recognition as a political-economic statesman. In the spring of 1923, as Secretary of Commerce, he warned the public that there were indications of an over-expansion of business activity and suggested a deferment of public construction expenditures. The writer has always believed that this action counted for more in checking business expansion at that time than did the small increases in discount rates which are generally believed to have done it. Under Mr. Hoover's administration the Department of Commerce devoted its energies to encouraging the accumulation and publication of statistical data which may make possible a better adjustment of individual programs to the general situation. Now, for the first time, he has an opportunity to test the possibilities of cooperative effort with Governmental leadership to shorten the downswing of business through a concerted concentration of effort.

Present Recalls Situation After Armistice

THE business situation at the close of 1929 suggests comparison with that of 1918. Then, as now, the economic organization of the country had received a terrific shock. Then the business world anticipated that the release of millions of men from military duty would at the same time create a vast burden of unemployment relief and make possible an output of commodities which would play havoc with the price level. War demand was about to cease, and vast industrial organizations would lose their only market. The stock market declined sharply in November; commodity prices turned downward, industrial activity slackened—all the familiar phenomena of the early stages of depression appeared. Agencies of the Federal Government called conferences of business men to plan how to avoid depression—in that case through agreements to stabilize prices rather than through efforts to increase production.

Then, as now, however, the center of depression was in the parts of the industrial organism that are farthest from the ultimate consumer. Production of basic raw materials fell off more than that of goods for consumption, and wholesale trade more than retail. Raw material prices fell most, the cost of living least. Curtailment of consumption was apprehended, and to get ready for it producers curtailed operations. The result, since consumers' buying slackened but little, was to use up stocks all along the line.

Consumers' Buying Power Was Underestimated

IN the course of a few months it became evident that business leaders had failed to take account of the enormous buying power which the farm population had accumulated through several years of prosperity, of the European demand that credit operations could change into actual buying, and of the demand that the return of the military forces would bring into the markets for civilian clothes, for housing facilities, and so on. Consequently the depression was very short-lived. Inventories were sold out; then industry set itself with renewed energy to building them up again—and this time caution was forgotten.

The details differ, but basically the present situation is very similar. Again a few industries really do face the probable necessity for adjustment to a market inadequate to utilize their capacity, but both rural and urban population have a purchasing power substantially unimpaired. Curtailment of businessmen's buying from one another has started in response to a consumers' market situation which is apprehended but not seen.

If we are right in believing that the high level of productive activity of the last two years has been only proportionate to the expansion of consumption and has not resulted in the general piling up of inventories of manufactured goods, and if the curtailment of business activity does not quickly run so far as to undermine its own market through curtailment of its wage payments, the most probable outcome is, as in 1919, an early realization that "the business situation is fundamentally sound." To the achievement of this end no better program than that now being fostered by the Federal Government and the United States Chamber of Commerce and other agencies could be suggested.

Two Risks in President's Program

TWO risks suggest themselves, however. First, it is not a sound long-run policy to meet threatened unemployment of labor by creating unemployment of productive capacity. If the construction program of 1930 is wisely planned it will at the same time relieve immediate fears of unemployment and bad trade and provide the ultimate basis for further expansion of both the production and consumption of the country. If, on the other hand, resources are turned into the production of types of building with which we are already supplied, of ships which can get business only by crowding other ships off the seas, into the digging of waterways to take care of non-existent traffic, immediate relief will only defer business difficulties. Second, and more serious, there is danger that if the present downswing of business shall be as temporary and as mild as those of 1919 and 1927 we may, as in 1919, sow the seeds of a worse harvest to follow. One of our most valuable business assets is the spirit of caution which the business world acquired in 1921. Commodity markets can run wild as easily as can stock markets. Too hasty an acceptance of the idea that we have mastered the technique of controlling business cycles may destroy the possibility of such control.

Favorable Factors

1. Unexpected strength of retail trade.
2. Improved farm situation.
3. Ample supply of credit.
4. Moderate inventories.
5. President's stabilization program.

Unfavorable Factors

1. Undercurrent of pessimism.
2. Sharp drop in activity of basic lines, such as steel and cotton.

Recommend Some Welding in New York Buildings

Technical committees which are assisting in the work of revising the building code of New York City have made recommendations to the Merchants' Association of New York, which, at the request of Mayor Walker, has undertaken the work of obtaining such professional advice.

One of the recommendations of the subcommittee on materials, loads and stresses is that welding, and in some instances bolting, be permitted as a cheaper means of construction and with a view to reducing noise.

This subcommittee also recommends an increase in permissible stresses of structural steel from 16,000 lb. to 18,000 lb. per sq. in., and a revision of the requirements in connection with wind pressure, with provision to be made in buildings for a wind load of 20 lb. per sq. ft. instead of 30 lb., as at present. It is recommended that the entire wind pressure be taken up in the frame of the building.

Proposed changes in the building code, it was stated, would effect savings of about 12 per cent in the cost of steel structures, this cost now representing 10 to 20 per cent of the entire cost of steel frame buildings.

Dinner Held for Apprentices at Milwaukee

The operating apprentice committee of the Milwaukee branch of the National Metal Trades Association held its annual booster dinner Nov. 11 in the Milwaukee vocational school, with Dr. Robert L. Cooley, director of the school, as speaker. About 200 men attended the dinner and later made a tour of the school. The Milwaukee branch of the National Metal Trades Association reports a steady increase in the number of indentured apprentices due to the combined efforts of school, state and industry coupled with a comprehensive program of education and work for apprentices.

Four-Company Steel Merger Announced

Republic, Central Alloy, Donner and Bourne-Fuller Companies to Be Consolidated—T. M. Girdler May Head Board—E. T. McCleary Probable President

CLEVELAND, Dec. 17. — Announcement was made here late today of the merger of important iron and steel companies which resulted in the formation of the third largest company in the United States.

At a meeting of the board of directors of the Republic Iron & Steel Co., E. T. McCleary, president, announced tonight, a plan was approved for the merger of his company, Central Alloy Steel Corporation, Donner Steel Co. and the Bourne-Fuller Steel Co. This plan will be submitted to the stockholders of the Republic company at an early date for their approval.

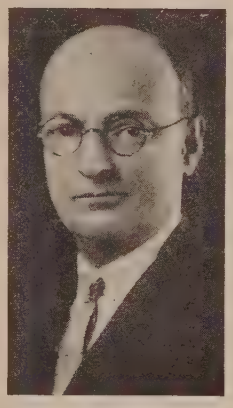
Similar action was taken by the board of directors of the Central Alloy Steel, Donner Steel and Bourne-Fuller companies, at which meetings the plan of merger was approved, and will likewise be submitted by each one of these companies to the stockholders for ratification.

Mr. McCleary said that the details of the merger are being worked out and will be made public later. He gave a general statement of the properties which will be included. These properties, which embrace a self-contained unit from raw materials to finished products, have combined total assets of approximately $350,000,000 and combined total annual sales of about $250,000,000. The total ingot capacity is approximately 4,900,000 tons a year. Pig iron capacity is estimated at about 2,400,000 tons.

The name of the new company probably will be the Republic Steel Co. As a working part of the merger there will be the Republic Research Co., to be devoted to exclusive research in all the processes and patents involved.

It is expected that T. M. Girdler, former president of the Jones & Laughlin Steel Corporation, will be chairman of the board of the new company. E. T. McCleary, of Republic, will be president. F. J. Griffiths, chairman of the board of Central Alloy, will be president of the research company, in charge of all the research and metallurgical work. The principal executives of the merged companies, in addition to the above, are B. F. Fairless, J. M. Schlendorf, of Central Alloy; H. T. Gilbert and W. M. Neckerman, of Republic; W. T. Witherow, of Donner, and R. S. Hall, of the Bourne-Fuller company. These, together with R. J. Wysor, formerly general manager of Jones & Laughlin, will constitute the active executive staff of the new company.

There was no announcement regarding the Youngstown Sheet & Tube Co. and the Inland Steel Co., which many had thought would be included in the merger when it was finally completed.



T. M. GIRDLER

T. M. GIRDLER, Former President of Jones & Laughlin Steel Corporation, is Slated for Chairman of the New Republic Steel Co. and E. T. McCleary, Now President of Republic, Will Continue in That Capacity in New Company

E. T. MC CLEARY

Lamson & Sessions Co. May Buy Foster Bolt

The Lamson & Sessions Co., Cleveland, has submitted an offer to purchase the Foster Bolt & Nut Mfg. Co., Cleveland, on an exchange of stock basis, and the directors of the latter company will hold a meeting this week to consider the merger. It is believed that the offer will be accepted. The Lamson & Sessions Co. recently acquired the Lake Erie Bolt & Nut Co., with plants in Cleveland and Birmingham. If it takes over the Foster company, it will also have a plant in Chicago in addition to acquiring the Foster plant in Cleveland. The Foster company has been in operation about 20 years and is understood to do an annual business of about $2,500,000.

American Steel & Wire Co. to Rebuild Newburgh Works

The American Steel & Wire Co., Cleveland, plans to start an extensive rebuilding program at its Newburgh steel works in Cleveland early next year. While details have not yet been worked out, the plans call for dismantling of the old plant and replacing it with an up-to-date steel plant with an increase in open-hearth and rolling mill capacity. Extensions will include the building of a new open-hearth department with a battery of 150-ton furnaces and blooming and finishing mill equipment. The plant now has seven open-hearth furnaces of 60-ton capacity. The construction program will probably extend over a period of a year or more. The Newburgh steel works were originally built in 1867-68.

Mining Institute to Be Held at Seattle

The annual Mining Institute at the College of Mines of the University of Washington, which is open to all persons interested in any branch of the mineral industry, will be held this winter at Seattle throughout the week beginning Monday, Jan. 20, 1930. The extensive new equipment for mining, metallurgy, and ceramics recently installed in mines laboratory will be used for instruction and demonstrations. In addition to the lectures by the regular staff of the college there will be talks by representative engineers and operators of the Northwest. In the evenings moving pictures of mining operations will be shown. At the last session of the Mining Institute 120 persons were in attendance. No fees are charged.

Algoma Steel Corporation, Sault Ste. Marie, Ont., will place its new 18-in. bar mill in operation this week. Its new 12-in. mill will begin operating about Jan. 1. The mills will have double the capacity of the ones they replace.

Reduced Iron Rates from South Denied

Commerce Commission Refuses Plea for Lower Tariffs from Alabama to North Central Points

WASHINGTON, Dec. 17.—In a decision made public last Thursday, the Interstate Commerce Commission held to be not justified proposed reduced rates on pig iron from points in Alabama, Tennessee and Kentucky to St. Louis and related or intermediate points in Illinois and Indiana. The schedules, which were under suspension, were ordered cancelled. They were filed by Southern carriers and supported by merchant blast furnace interests in the South. Opposing the schedules were pig iron producers in the St. Louis, Chicago, Cleveland, Youngstown, and Duluth, Minn., districts, consumers at Metropolis, Ill., Louisville and Newport, Ky., and Northern carriers.

From Birmingham to St. Louis, it was proposed to establish a rate of $3.69 a ton, a reduction of 73c. from the present rate of $4.42. Other proposed reductions ranged from 41c. to 72c.

The commission did not support the contention that the decline in tonnage of pig iron from Southern furnaces marketed outside of Southeastern territory was due to unfavorable rates. The accumulation of stock and depression were attributed in part to a general decline in the demand for pig iron, which has been felt by Northern as well as Southern producers by reason of the increased use of scrap. In the South, it was said, it is particularly due to the depressed condition of the cast iron pipe industry.

On the other hand, the commission concurred in the protest of Northern lines that, if the proposed reduced rates were allowed to become effective, the Northern producers would demand corresponding reductions from their furnaces, which, "because of competitive conditions, they will find it difficult to deny." Central carriers expressed the view that, if the proposed rates became effective, the Southern carriers would later find it necessary to make reductions in the rates to the Ohio River crossings sufficient to restore the present relation to the rates to St. Louis.

"These protestants state that if this should be done, producers located on their lines would demand corresponding reductions in their rates to the same destinations in order to meet the competition from the Southern furnaces," the opinion said. "Due to the geographical location of the furnaces in Central territory such requests could not be granted without a general revision of all the pig iron rates in Central territory, resulting in a very substantial depletion of the revenue of the Central lines."

Little Steel Improvement Expected Before March

The trend in the use of scrap in steel manufacture has been upward since 1923, with the trend of pig iron downward, declared Prof. Spurgeon Bell, head of the Bureau of Business Research, Ohio State University, at a meeting of the Cincinnati chaper of the Institute of Scrap Iron and Steel, held at the Deschler Hotel, Columbus, Ohio, on Dec. 11. By means of charts, Professor Bell demonstrated that the scrap market is a barometer of conditions in the steel industry.

In analyzing the prospects for the steel industry in 1930, he stated that the recession in steel operations would continue further beyond the beginning of 1930 than in previous years, with the result that there will possibly be no marked improvement until March or in the second quarter of the year. The conditions in the automobile, railroad and construction industries, however, warrant the prediction that the year 1930 will show good prospects for the steel industry.

"The prospects for the steel industry in 1930 are tied up with the prospects of the three principal consumers of steel—the automobile industry, the railroad industry and the construction industry.

"The automobile industry will continue on a lower scale in 1930. The delay brought about by the change in the Ford model developed a big deferred demand for cheaper cars in 1929, amounting to nearly three quarters of a million cars. When this demand was satisfied during this year, we were confronted with a normal demand for automobiles. In 1930, the demand should be approximately 500,000 cars less than in 1929.

"In the construction industry, the years 1921 to 1925 saw the largest boom in construction, with the result that the post-war demand for construction was satisfied during this period. The bull market discouraged speculative construction, and money was diverted to the stock market, bringing a decline in construction during 1929. The factors that should bring about an improved demand in the construction industry are the following: Rents have declined from 1925 to 1929, and the rent curve has now flattened out and is more stabilized. The cost of construction, which declined over a period of years, became stabilized in the middle of 1929. Interest rates will be easier as the result of the deflation in the stock market.

"The general expectation that a tremendous flood of money will now be available for the mortgage market is somewhat overdone. Capital is scarce all over the world, and there probably is not the large demand for bonds that some people expect. My own opinion is that it will not be long before another bull market will result.

"The railroad situation is particularly favorable for 1930. A good demand began in 1929 and will go forward in the next year. The excess demand in the railroad situation will offset any loss in the automobile industry.

"All indications are that the present decline in steel production will go further this time than in years past. There will possibly be no improvement until March, 1930, with the first quarter poor, the second quarter better and the second half improved."

Market Research in the Malleable Industry

The scope of activities of the Malleable Iron Research Institute will be materially enlarged in order to broaden the field for malleable castings. Action on the extension of work of the organization was taken at the annual meeting of the institute held in Cleveland, Dec. 11.

Laboratory and metallurgical work up to the present has dealt mainly with improving the quality of the product and the efficiency of plant operation. This phase of production research will be continued on an enlarged scale, supplemented by comprehensive plans for shop practice and product inspection services. In addition a broad program of market research will be undertaken which will include a comprehensive survey of the industry.

This will embrace thorough studies of new uses and applications, of specifications of materials for specific purposes and of the study of marketing conditions as affecting the use of malleables, all of which will be supported by a broad program of cooperative advertising. One subject that will be considered will be the provision of different specifications for malleable castings providing specifications for castings for different services to supplement the present single standard specifications of the institute. For the effective conduct of the enlarged activities the personnel of the institute will be increased by an additional administrative executive and field engineers.

R. R. Fauntleroy, Moline Malleable Iron Co., St. Charles, Ill., who became president of the institute early in the year to fill the vacancy caused by the death of Frederick L. Sivyer, was elected president for the ensuing year. Other officers elected were: vice-presidents, John G. Malnoski, Muncie Malleable Foundry Co., Muncie, Ind., and Joseph P. Kennedy, Baltimore Malleable Iron & Steel Castings Co., Baltimore; secretary-treasurer, Robert E. Belt, Union Trust Building, Cleveland.

This Issue in Brief

Wanted: skilled mechanics. Even in relatively dull times skilled mechanics can no longer be hired at will. Apprentice-training is the only answer to the serious problem facing industry. —Page 1662.

* * *

Tool life not increased much by coolants, but they do improve the finish, tests reveal.—Page 1704.

* * *

You waste fuel if you operate your cupola slowly, and the iron undergoes undesirable changes. Uniform output can be obtained at high melting speed.—Page 1659.

* * *

Millions of dollars in transportation costs being saved by river shipments of iron and steel products. Increased competition forces great growth in barge transportation.—Page 1661.

* * *

Greater strength of pressure die castings than in the gravity type is due to difference in structure of metal. Improved zinc-base alloys have greater tensile strength than sand cast brass or bronze.—Page 1658.

* * *

Longest life in broadnose lathe tools is obtained with a back slope of 30 deg. Side slope of 0 deg. is better than one of 8 deg. —Page 1704.

* * *

Doubles machine shop output without buying new equipment. Shop rearrangement, material routing system and incentive system are responsible.—Page 1649.

* * *

Anneals aluminum aircraft engine castings at 960 deg. Fahr. For economy in handling, an electric truck-loading oven is used. It handles two cars.—Page 1650.

Your machine shop costs will fall if you establish standard speeds and feeds. The use of these standards is habit-forming among workmen.—Page 1649.

* * *

Don't expect wage incentive plan to produce wonders, unaided. Bad practices must be corrected. The new plan must be carefully fitted into the shop program.—Page 1647.

* * *

High-speed steel's most important constituent is cobalt, tests reveal. Five per cent is the maximum for economy. Best results are obtained only with high hardening temperature.—Page 1704.

* * *

Dished disk springs have many advantages for application where space is limited. They are cheap, durable, adjustable in height and flexibility.—Page 1664.

* * *

To safeguard crane operator, support the cab separately from load, says tramrail maker. Then if the operator tries to pick up something attached to the floor and the load-carrier breaks, the operator will not be hurt.—Page 1662.

* * *

Increases stockroom capacity 400 per cent and saves cost of new building by standardizing on parts containers, piling them four or five high, and handling them with overhead conveyor.—Page 1654.

* * *

Decreased machining and assembly costs are frequently obtained by using die castings with steel inserts. Alloy shrinks just enough to anchor the insert so firmly that the casting must be broken before insert can be removed.—Page 1658.

Simplifies stock-keeping system by establishing a definite stock run for each model of machine. Then washing-machine manufacturer orders just enough parts for the stock run.—Page 1654.

* * *

Output of foundry increased 75 per cent without additional help or equipment. Arrangement of flasks in orderly manner, delivering to molders the patterns next required, and wage incentive system are responsible for marked savings.—Page 1649.

* * *

Cupola is no longer "she." It is a piece of mechanical equipment, and therefore subject to laws of mechanics and physics.—Page 1659.

* * *

Don't hamstring the new machine by putting on the whole burden of cost reduction. Flow of material, men and methods must be coordinated if best results are to be obtained.—Page 1647.

* * *

Salvages imperfect aluminum castings by preheating to 900 deg. Fahr. in welding furnaces and filling up the blowholes by welding the hot castings.—Page 1651.

* * *

Modulus of elasticity of a metal is not an absolutely fixed quantity. Overloading in tension beyond the yield point lowers the modulus of elasticity with respect to future lighter loads.—Page 1665.

* * *

New field yields low-cost, high grade iron ore. Normandy, France, region develops into one of the world's large iron ore reserves.—Page 1667.

* * *

Economical cutting speeds for finishing cuts can now be determined accurately. As a result of exhaustive tests, engineers evolve formulas for both high-speed steel and carbon-steel tools. —Page 1663.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Next Year's Steel Prospects

BOTH precedent and an analysis of policies of steel buyers at the moment indicate that this year's lame ending in steel demand is not a criterion of what the early months of the new year will show. It was pointed out in this department in the issue of Oct. 24, exactly before the series of stock market crashes had begun, that each year in steel seems to take a fresh start, that if the old year ends well the new year carries the momentum, while "apparently if a year ends poorly demand accumulates."

With the limited number of years we have had since the post-war inflation and deflation there has been supplied a remarkably wide variety of precedent that good or bad endings of a year mean nothing to the new year. There was 1923, with monthly declines in steel production after April and clear through December, yet with 1924 opening very well indeed. It ran into bad things after March, but that had absolutely no connection with the 1923 ending. Then there was 1927, with its whole second half bad, and 1928 started out well, incidentally ending still better.

So much for the reassurance of precedents, that there is no precedent of a poor year ending being carried over. In the various cases the seasonal influence was too strong. As to the attitude of steel buyers, the unsettlement produced by the stock market, waning of late, induced a policy all along the line of particularly drastic curtailment of stocks. The application runs from the primary raw materials along down to final consumption, in many cases through numerous stages.

Steel mills themselves have been curtailing in this respect, whereby on a given date their ingot production is below the usual ratio to the shipments of finished products. The manufacturing consumer, the further manufacturer, if any, and the dealer all curtail. There may have been no stocks that could be called reserve stocks, but stocks that are ordinary stocks in ordinary times look too large in times like these, and with declining operations the volume of material in progress is reduced. Thus almost everywhere less has been going into a manufacturing establishment or a warehouse than has been coming out.

After the turn of the year, which involves the formal Jan. 1 inventory with its influence upon the balance sheet and the year's financial showing in general, and also involves a sudden commencement of looking forward to seasonal spring activity and preparation for it, the reverse action or rebound is in order. After rigid curtailment the disposition will be to return toward, if not to, normal or average. There will be a favorable sentimental influence.

In the last few years we have been much disposed to write "sentiment" and "tone" out of consideration of market or trade conditions, but no one can fancy that, if complete departure did occur, the very special developments of the last few weeks would not bring a reversal. Whereupon we may reasonably expect that unfavorable sentimental influences of the last few weeks will be replaced by more favorable sentiment as actual seasonal revival in trade begins to appear.

Ties Among Industrial Nations

PAYMENT of international war debts is going to involve sales development of enormous proportions. In times past, international obligations could be discharged by the payment of tribute to a royal treasury in gold, ivory, jewels or other exotic material. Such possibilities hardly exist today.

Direct payment in competing goods could not well be accepted unless demand could be expanded sufficiently to absorb the foreign products without at the same time checking the sale of the home products. Prohibitive tariffs give effect to refusals of nations to accept payments in goods; and the objection to payment in services, competing with the labor of the creditor nation, is also strong.

The result is that debtor nations must exchange their domestic products with countries which are the sources of exotic raw materials or of products which the creditor nations are willing to accept. Meanwhile demands of the debtors for increased capital to finance their growing business attract private loans from the creditors. Interest charges upon the debtor nations accordingly grow larger, intensifying the need of more export trade to be gained at the expense of the creditor nations.

It ought to be generally recognized that, while a high protective tariff is calculated to foster the development of the home industries, it is also forcing the development of the industries of debtor nations, for the investment of capital in foreign industries will strengthen the foreign industrial position. Thus the industrial nations will tend to be tied together more and more by international investments and industrial organizations—a condition which may be a powerful factor in the promotion of world peace.

Trends Regarding Old Age Pensions

THE movement in favor of the state paying old age pensions is growing. The sentimental appeal is so strong that we may rest assured from a purely psychological viewpoint that sentiment is the chief motivating force. Mortality statistics and facts in commerce and industry as to changing character of gainful occupation are naturally cited to help support the case. Putting sentiment entirely out of the reckoning, the purely factual trends affecting this problem may be reviewed. They include items of longevity, life insurance and annuities, thrift, housing conditions and character of occupation.

Mortality statistics are often cited loosely, particularly so when only life expectancy is mentioned. That has sharply increased, but chiefly by reason of a large decrease in infant mortality. The life expectancy of those aged 50, say, has not greatly increased. What one would like to do is construct series of curves, of this and other things, and combine them into one general curve showing how, from a purely statistical and factual basis, the need of pensions has varied over a period of time, say in a generation. The curve showing variation in life expectancy of those aged 50 would not be a final showing because physical condition of the more aged may vary from time to time. Improved habits of life are directed not so much at prolonging mere existence as at preserving physical and mental ability. A curve should be plotted for that item also.

The great increase in life insurance and annuities is an outstanding fact, and it plainly is in the direction of lessening the need of state old age pensions.

The change in habits of "thrift," whatever that may mean precisely, would if measurable make a particularly interesting curve, bearing on this general subject. On the one hand we have the increase in savings banks deposits and on the other hand the greatly increased tendency to buy not only what one has cash to pay for but to buy on installments, and however simply the proponents of one pension idea or another may put it, the data by which the thrift curve should be compiled are really very complicated.

The curve as to housing conditions is relatively much simpler but even it has some complications. For recent years there are statistics of housing construction, showing a continuous decrease in the proportion of facilities provided in one-family dwellings. In this and other ways the trend has been marked, for people to live in smaller quarters, whereby relatives have less facilities to take care of those who cannot take care of themselves.

In character of occupation we have the greatest changes, requiring in fact a series of curves. Obviously the farmhouse can better take care of its aged than the city dwelling, and the proportion of farming population shows a steady trend downward. Next there is the trend from individual business to working for hire, very marked as a purely statistical matter but very untrustworthy for purposes of conclusion, for the man in business may be less disposed to lay up for old age than the salaried man or wage earner. He may trust too much to his business while an increasing proportion of wage earners are protected by their employers. Then in factory work we have sharply increasing mechanization, whereby some work is made easier for older men and some work is made impossible.

Everyone readily feels the fascination of sentimental arguments for and against state pensions. The purely statistical and material items also have their fascination for they present interesting complications, while at the same time they represent trends which have been in force and are altogether likely to continue in force.

The Place of the Visiting Nurse

A SURVEY has been made lately of the results of the work carried on among employees and their families by the visiting nurses who have been for the past ten years on the staff of a large manufacturing company in New England. All through the decade detailed records were kept of the two nurses' visits to employees' homes. These included the name of the person who needed care, whether worker or member of his family, the nature of the ailment, number of visits required in each case, and any other fact that seemed worth recording. The data accumulated were found ample for purposes of analysis. According to officials the opinion was confirmed that the visiting nurse system gives a large return on the outlay. The nurse has proved to be the most intimate and perhaps the most valuable means of contact between the company and its employees, and as such to have contributed much to the maintenance of works morale at the high standard that has been in evidence in various ways.

The industrial nurse is no longer a rarity. At many industrial plants large enough to justify the money cost she has become an adjunct of hospital or dispensary. Groups of smaller plants have worked the plan on a cooperative basis, and others have availed themselves of the community's district nurses. But not a great deal has been made public as to the results of the nurses' work. In the case in question, conclusions were based on between 35,000 and 40,000 professional visits. In 1928 alone the nurses made 3800 calls, an average not much under one to the employee, and considerably more than one for each head of a family.

Far the greater number of patients attended were not employees but members of their households. They have been encouraged to regard the nurse as some one to call upon in time of need, not as a special privilege but as a right. They do not wait for the news of their troubles to reach the authorities in some roundabout manner. They notify the hospital and ask for a nurse. In fact, sometimes they demand her immediate presence; and this the management, instead of resenting, rather welcomes as a symptom that the nurse is accepted as an integral factor in the institution. It was not so in the beginning of the work. She was met with suspicion and aloofness. Espionage was suspected. She often received scant welcome, and sometimes was refused admittance, usually by the housewife. But patience and tact finally won the day.

The position of the plant nurse today is that of family confidante to people of a wide range of nationalities and creeds. They have learned that she holds a secret inviolate, and never tells of things she sometimes sees, the betrayal of which might make trouble. Particularly in matters of hygiene is her influence marked. Cleanliness has become more nearly uni-

versal. The family diet, including the dinner pail of the wage-earner, has become a very different affair.

In the opinion of the works physician the health of workers and their dependents is much better than would have been the case with no nurse working among them. In the plant she has been a direct influence in reducing absenteeism, as there is no need that men stay at home to care for the sick. Worry, which destroys efficiency, has been to no small extent alleviated. Altogether there is good ground for the statement of an officer of the company referred to that, if the time should ever come when personnel activities are curtailed, one of the last features to go would be the work of the visiting nurse.

Optimism Features Steel Foundry Meeting

Operations Excellent and Outlook Good, According to Those Attending Pittsburgh Meeting

THE outlook in the steel castings industry is excellent, according to statements by 65 executives at the regular monthly meeting of the Steel Founders' Society of America, Inc., held at the William Penn Hotel, Pittsburgh, Dec. 12.

The present rate of operations was reported as 86 per cent of capacity in the Eastern district, 92 per cent in the Middle West and 100 per cent in the Central Atlantic district. The average for the past decade has been between 55 and 60 per cent of capacity. Shipments are now running at 95 per cent of capacity, and inquiries show only a slight decrease as compared with the same period a year ago. Raw material prices were reported as having shown a slight decrease except in Detroit and in Ohio, where large purchases had recently caused a sudden upward trend in scrap quotations.

With but few exceptions manufacturers of railroad castings, automotive and mill equipment, as well as producers of miscellaneous steel castings, pronounced the present volume of business and the future outlook favorable. Sales prices have been advanced on practically all classes of work, and present bookings run two months into 1930.

The fact that 75 leading executives of the industry attended the meeting indicates the interest that is being taken in the society under its new plan of organization. The proper application of cost-finding methods, the correction of loose trade practices and customs, and the checking of overexpansion and internal dissension are among the problems stressed in the society's program. Results have already been achieved in connection with balancing capacity with demand, as evidenced by the reported abandonment of a number of poorly conceived projects.

Has Employment Bureau Already Operating

The society has had an employment bureau in operation for several weeks, and as a first step in handling trade disputes has formally indorsed and adopted the principles of the American Arbitration Association.

Plans were laid for establishing a special group within the society for producers of alloy steels and special acid, heat and corrosion-resisting products, so that their particular problems can be handled more effectively.

At a meeting of the Small Castings Division, led by H. J. Koch, Fort Pitt Steel Casting Co., McKeesport, Pa., a permanent organization was effected and a program of subjects to be presented at future meetings was developed. The group will confine its work largely to questions of merchandising and distribution, although operating phases of the business will also be covered.

Society's Data Effect Savings in Operating Costs

The chairman of the Large Castings Division, George H. Friesel, United Engineering & Foundry Co., Pittsburgh, led a discussion of operating data compiled by the society, as a result of which one member stated that his company had saved $18,000 in operating costs, while another reported a definite saving of $6,000.

The general meeting was presided over by the society's vice-president, John E. Galvin, president, Ohio Steel Foundry Co. Granville P. Rogers, managing director, read a report in which he called attention to the work now being done by the cost accounting committee, which will make recommendations for improvements in present practice, after which the methods developed will be ratified and a continuous effort will be made to obtain general adherence to a uniform plan. He reported the progress made to date in developing a standard set of trade customs and a standard sales contract.

An address on "Undeveloped Wealth in the Steel Foundry" was made by George Batty, technical director, Steel Casting Development Bureau, Philadelphia. He called attention to the fact that foundry superintendents acquire a large amount of data on foundry operation that they do not fully understand and, if they do, do not have the time, opportunity or training to deduce from their observations improved practices or remedies for adverse conditions noted. These empirical facts existing in the minds of foundry operators constitute unexploited wealth, he declared, for if they were collated scientifically new methods could be devised that would materially reduce wastes in both material and human energy.

New England Construction Interests Meet

At a joint meeting of sales staffs of various companies handling structural steel, gypsum, brick, terra cotta, lath, bar joists, etc., under the auspices of the Structural Steel Board of Trade of New England at the Copley-Plaza Hotel, Boston, on Tuesday, Dec. 10, Lee H. Miller, chief engineer, and Charles F. Abbott, executive director, American Institute of Steel Construction, Inc., were the speakers. The meeting was presided over by Harry W. Fitts, New England Structural Steel Co. Charles N. Fitts, president of the national organization, attended.

Mr. Miller's address largely concerned recent developments in fabricating methods. Special emphasis was placed on battledeck flooring and its advantages in construction of tall buildings. In connection with steel floor plates attention was called to an automatic welding machine developed by the General Electric Co., which was demonstrated at the recent annual meeting of the American Institute of Steel Construction. The new welder is operated by one man.

Mr. Abbott's address was largely on salesmanship. He said, in part, that while financing and manufacturing are highly important branches of industry, our great problem today is distribution. He pointed out that a great many salesmen lack terminal facilities—they do not know when to stop. A salesmanship survey recently made, he said, showed that 1714 untrained salesmen sold $19,000,000 worth of goods in a given time, while 500 trained men, in the same period, sold $50,000,000 of the same kind of goods. Just how seriously American industry is taking the distribution problem, Mr. Abbott stated, can be realized when it is known that it is spending $6,000,000 annually in sales promotion, as compared with $200,000 so expended 10 years ago.

Mr. Abbott assured those present that the use of fabricated steel in 1930 will exceed all previous yearly records in this country, and that 1931 will be an even greater year than 1930. He predicted the erection of 100-story buildings on large city plots.

Steel Corporation May Acquire Atlas Cement

An offer to acquire the Atlas Portland Cement Co., through an exchange of stock has been made by the United States Steel Corporation, according to a letter sent by the Atlas company to its stockholders. The letter, signed by John R. Morron, president of the company, asserts that officers of the company consider the offer very favorable, and urges stockholders to approve. A special meeting of stockholders of the Atlas company will be held Dec. 28 to act upon the proposal.

The transaction will involve 180,000 shares of United States Steel common stock in return for the outstanding stock and the entire assets of the cement company.

The capitalization of the Atlas Portland Cement Co. consists of 899,211 common shares, so that, at $167 a share for Steel common, the deal would involve slightly in excess of $30,000,000. In addition, the Steel Corporation offers to assume all existing liabilities of the company.

This contemplated expansion of the Steel Corporation would bring its rated Portland cement capacity to approximately 36,500,000 bbl. annually, constituting by a considerable degree the largest unit in the industry. The Atlas company and the Universal Portland Cement Co., the latter the cement subsidiary of the Steel Corporation, are among the four largest producers in the country, and their consolidation will place the leading steel producer in a dominant position in the cement industry.

Holders of a substantial majority of the stock of the cement company have given their approval of the transaction, and the directors have voted to accept the terms of the Steel Corporation.

Manufacturers of Resistance Welders Consolidate

Consolidation of the Thomson Electric Welding Co., of Lynn, Mass., and the Gibb Welding Machines Co., of Bay City, Mich., has been effected. The new company is known as the Thomson-Gibb Electric Welding Co. Both plants will continue in operation.

The former company is a pioneer, having been formed in 1886 to exploit the basic patents of Prof. Elihu Thomson. Professor Thomson has always been an officer and director, and will continue with the new company in both capacities. The Gibb company has been one of the most active in the West and has specialized in seam welding.

The Thomson-Gibb Electric Welding Co. will market a full line of butt, flash, seam, spot, projection, and wire fabric welders. It is fully aware that the user of welding machines is not so much interested in the machine as in the product of that machine, both from the standpoint of uniformity, and of uninterrupted production. The welding machine is but one of many special machines in a manufacturing plant. It is impossible to have in an organization an individual who would be as well acquainted with the welding machine itself and its ultimate capability as is the manufacturer of that machine. Therefore, the Thomson-Gibb company proposes to maintain service engineers to make frequent inspection calls upon its customers and to act in an advisory capacity. For this purpose competent factory trained engineers will be stationed at Boston, New York, Philadelphia, Cleveland, Cincinnati, Detroit, Chicago and St. Louis.

The Week in Business

Drift of Current Financial and Economic Opinion

WIDELY differing views on the business situation indicate a persistence of the confusion and perplexity into which the country was thrown by the stock market panic.

Col. Leonard P. Ayres believes it unlikely that the current trade recession will develop into a depression. "Speculation has come out of the stock market in a hurry," he writes, "but by and large we have no great amount of speculation to come out of business."

Sees No Early Recovery

A sharply divergent opinion is held by the *Annalist*, which says that "it has become clear that the business reaction is much more severe than had been generally believed," adding that no important recovery is in prospect for several months. A preliminary calculation of the *Annalist* index of business activity for November showed a drop of 10 points, the greatest decline in 11 years and comparing with a recession of 7.6 points in January, 1921, the sharpest previous monthly decrease recorded.

A survey of the whole field of business, according to Benjamin Baker, editor of that journal, forces the "realistic" observer to be skeptical of the ultimate value of the Washington program of "cheerio." "It is a good thing for the leaders of business to consult, and to try to work out a practicable stabilizing program; but to ignore facts is to court defeat."

But Forecasters Often Err

Less faith in the forecast value of statistics is shown by Alexander D. Noyes, New York *Times*, who points out how frequently business analysts have erred in recent years, even in near-range prophecy. He says, in part:

> A year ago this month not a single voice predicted the main event of 1929, the October panic. On the other hand, forecasts for such a twelve-month as 1926 were extremely guarded in relation to the last half of the year—a caution which turned out to have been unnecessary. On New Year's Day in the year of spectacular deflation of staple prices, 1920, the majority of experts prophesied over their own names that prices could not decline.
>
> Of recent years it has grown to be a habit of December prophets to describe with confidence the course of events in the next six months; but to beg off from telling the secrets of the autumn. Yet at the start of 1919, a year of inflated wages and profuse expenditure by the working classes, high authorities predicted "bread lines in every industrial center before May 1."

Recognizing that sentiment is, after all, a leading force in shaping business, Mr. Noyes concludes that the President's vigorous program has added great force to other psychological considerations and "may turn out to have influenced tangibly the general course of trade."

Federal Reserve Policy Criticized

Also stressing the importance of building up business confidence, the *Financial Chronicle* finds that efforts to that end by the President's conferences are being vitiated by Federal Reserve policy. By adding heavily to their holdings of Government securities and acceptances the Reserve banks are creating unneeded credit and are driving gold out of the country. This outflow of yellow metal, the *Chronicle* declares, is the disturbing influence that caused the last severe setback in the stock market.

Condemning what it calls a repetition of the easy money policy of 1927, which forced large exports of gold to Europe and encouraged stock market inflation, the financial journal characterizes present open market operations as "a meddlesome interference with the natural functioning of the Reserve system," which "should be discontinued for the benefit of all concerned."

Iron and Steel Markets

Further Shrinkage in Production

Steel Output Receding as Buyers Defer Purchases—Motor Car Output Rising—Scrap Steady—Semi-Finished Steel Weakens

THE anomalous situation of production shrinking and confidence rising characterizes the steel market as the year-end approaches. Producers are now satisfied that the sharp decline in steel output that began in late October was a psychological effect of the stock market crash and greatly exceeded the actual contraction in steel consumption.

The damper that the Wall Street panic put on steel buying, it is believed, greatly accentuated a trend that was already under way, giving the appearance of a sharper reduction in demand than actually occurred except in the automobile industry. The effect on buyers has been to make them still more cautious, with most of them drastically cutting down their inventories and withholding action on their first quarter needs.

Prices of finished steel are feeling the strain of curtailed buying, and pressure for concessions, particularly on the part of the automobile makers, is insistent. But steel producers are not attempting to force sales and have become reconciled to a further reduction of mill operations before Jan. 1. Prices of some products are wavering, particularly certain finishes of sheets, but there have been no additional open breaks in the market.

Mills believe that customers will be forced to enter the market in January, possibly in sufficient numbers to create a rebound in demand comparable with the recent slump in buying.

In this connection the immediate translation of expanding motor car production into steel orders is regarded as significant. While the rise in automobile output is slow and steel producers are not yet disposed to look for a real recovery before the end of the first quarter, the outstanding fact is that the trend is upward. Makers of low-priced cars are getting under production more rapidly than those manufacturing more expensive models. The Ford Motor Co. is understood to have a daily schedule of 4500 cars this week, a gain of 700.

While none of the motor car builders is making extended commitments in steel, improvement in orders and releases is making itself felt, particularly in carbon and alloy steel bars. Two of the larger independent mills in northern Ohio have increased ingot output to 60 per cent of capacity.

Ingot production generally is still declining. The average for both the Steel Corporation and Bethlehem plants is down to 65 per cent, compared with 68 per cent a week ago. Chicago district output is holding at 65 per cent, but the rate for Pittsburgh and tributary areas has gone down five points to 60 per cent and may drop as low as 50 per cent in another fortnight. Plans call for a sharp reduction of finishing mill operations, with the likelihood that many sheet, strip, bar and tin mills will suspend completely during Christmas week.

Support of the market by the railroads, the structural steel industry, farm equipment makers and shipyards has not relaxed and demand from some of the miscellaneous users shows signs of reviving. Releases from barrel manufacturers have improved and the requirements of wire rope makers are large. Heavy machinery and equipment makers will enter 1930 with unusually well filled order books.

Scrap, which is regarded as a sensitive barometer, remains firm for second week at Pittsburgh and Chicago, with several advances of minor grades reported at the latter point.

Semi-finished steel, on the other hand, shows weakness. A few Ohio mills have reduced billets, sheet bars and slabs $1 to $34 a ton.

Washington construction programs will not stimulate business for some time, but activity in structural steel remains at a high level. Fabricating awards total 51,000 tons, compared with 35,000 tons last week. Fresh inquiries call for 42,000 tons.

The Canadian National Railways have ordered 4650 cars and the Milwaukee road is in the market for 2300. The Louisville & Nashville is expected to inquire for 1823 cars.

The deadlock that exists between buyers and sellers of steel is duplicated in large measure in pig iron. Curtailment of blast furnace operations has tended to keep production in step with reduced demand, although some piling up of iron is reported at Chicago. In certain centers accumulating requirements have forced melters to increase their purchases, but in other districts foundry operations have fallen off and considerable unshipped tonnage will be carried over into the first quarter. Prices are softer in New England and have declined 50c. a ton in eastern Pennsylvania. Alabama producers have advanced quotations 50c. to $15 a ton, Birmingham.

The merger of the Republic, Central Alloy, Donner and Bourne-Fuller companies will have a combined ingot capacity of nearly 5,000,000 tons a year, making it the third largest steel company in the country.

THE IRON AGE composite price for pig iron has declined from $18.29 to $18.21 a gross ton, a new low for the year. Finished steel is unchanged at 2.362c. a lb.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

Pig Iron, Per Gross Ton:	Dec. 17, 1929	Dec. 10, 1929	Nov. 19, 1929	Dec. 18, 1928

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Buying Restricted to Small Lots—Moderate Improvement in Orders from the Automobile Industry

PITTSBURGH, Dec. 17.—While business with some of the mills in this territory is somewhat better than it was a month ago, buying is still restricted to small lots, and the great majority of the larger consumers who might be expected to cover their first quarter needs at this time are holding back. Nevertheless, sentiment in the industry is good, and the expectation of renewed demand in January continues.

Notably encouraging in the last week has been the placing of small orders by automobile manufacturers, but the volume of business from this source by no means promises a heavy demand during the first quarter. In fact, estimates of automobile production in the first quarter by many of the leading manufacturers range from 20 to 40 per cent of the rated capacity of plants, and the high January quota of the leading maker of cars in the low-priced field is certainly not to be taken as a criterion of the industry as a whole.

However, the immediate Pittsburgh district is not so dependent upon the automobile industry as are mills in the Valleys and the Wheeling area, and the prospects of demand for the steel products which do not go to the automobile makers are not so obscure. Heavy demand for plates, shapes and heavy sheets from the railroad car builders is assured by the large orders on their books, and the outlook for barge and shipbuilding work is much better than it was this time last year. Continued industrial expansion in this vicinity insures a good demand for structural material from this source alone, and plans for important public improvement work promise a substantial business. Lower money rates are already stimulating general building activity, which was impaired considerably in the year coming to a close.

Plans of the agricultural implement industry for 1930 call for no curtailment of earlier schedules. Heavy machinery and equipment makers normally absorb a good percentage of Pittsburgh's finished steel products, and companies engaged in this work will enter 1930 with unusually well filled order books.

The outlook for pipe is more or less uncertain, but there is no reason to believe that the usual seasonal demand will not set in as the year progresses.

Under these circumstances, mills are certainly justified in facing the new year with a fair degree of confidence.

Steel users are allowing their stocks to decline to the absolute minimum at this time and mills are meeting this situation with plans for sharply curtailed production in the next fortnight. This week finishing mills are at a slightly better rate, but Christmas week will see complete suspension of operations in many sheet, strip, bar and tin mills.

Ingot operations for the Pittsburgh and tributary districts may be expected to decline to about 50 per cent of capacity, and present schedules of open-hearth departments are certainly not higher than 60 per cent.

Prices on finished steel products are feeling the strain of curtailed buying, but in no cases have open breaks occurred. Mills are carefully avoiding any semblance of pressure upon buyers, but the latter, particularly in the automotive industry, are inclined to

press for concessions all through the list. Many small buyers have been willing to extend their present contracts at unchanged prices, but large users are waiting market developments and many already indicate that lower quotations have been offered them. Under such circumstances, it is safe to assume that first quarter prices will receive no real test until January.

Pig Iron.—A few small inquiries have come out in the last week but none of these calls for other than current needs. In fact, orders are occasionally placed for split carloads of two grades of iron, and it seems that consumers are determined to have no stocks at the end of the year. Further curtailment of shipments is also reported by many sellers, and in some cases complete suspensions for the next two weeks have been placed in effect. Few foundries have enough iron coming to them on old contracts to enable them to operate well into January, but others, which are disposed to wait for a while before contracting for their first quarter needs, will have to place small supplementary tonnages in the next few weeks. In the meantime, furnaces are determined not to let their yard stocks increase, and additional stacks may be banked before the end of the week. This attitude gives the price situation more strength than it would have ordinarily in a period of such light demand, and the small tonnages of iron which are being sold from time to time are bringing the full quoted prices of $18.50, Valley, for basic and foundry iron, and $19 for Bessemer and malleable. These quotations will probably not be tested by any substantial tonnage until after the end of the year.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel. — Shipments are very light this month. Some makers are producing more than they are shipping. One or two of the larger mills in the district are said to be accumulating reserve stocks of semi-finished steel in anticipation of heavy rollings of other products, notably rails, in the next two months. However, this practice is economical only with Pennsylvania mills, and not with producers in Ohio and West Virginia, which must pay large year-end inventory taxes. From a sales standpoint, the semi-finished market is extremely dull, and price uncertainty continues. The market is nominally quotable at $35, Pittsburgh or Youngstown, and some mills are still shipping against contracts made at this figure. However, this price is by no means established on first quarter business. On forging billets, the $40, Pittsburgh, quotation is still made, and is applied to a small tonnage of first quarter business. However, this price ordinarily depends on the rerolling billet quotation, and contracts would probably be marked down in case billets declined. Wire rods are holding at $40, Pittsburgh or Cleveland, and first quarter contracting is proceeding at a fair pace.

Bars, Shapes and Plates.—Business is still quiet, and specifications reaching mills largely call for immediate shipment. A fair tonnage, specified for early January delivery, is beginning to accumulate with some companies, but this business is not yet affecting operating rates in this district. Structural mills are running fairly well, and demand from fabricators, working on large jobs, is steady. The railroad car builders have called for little tonnage as yet on recent orders, but this business is certain to develop in January and continue for several months, if car builders' order books may be taken as an indication. Pittsburgh mills will soon figure on a postoffice at Baltimore, which will take about 4500 tons of shapes and at least 500 tons of reinforcing bars. A sewer job at Columbus, Ohio, will also require 300 tons of reinforcing steel. Otherwise the reinforcing bar business is seasonably dull. Barge awards are lacking, but prospective work continues to attract interest. The Standard Unit Navigation Co., which earlier in the fall announced its intention of buying 50 small barges, now expects to buy 60, but there is little likelihood that this business will be placed before spring. The automobile industry is not yet placing orders for bars in this district in any considerable amount, although some small tonnages, apparently required for new models, are coming to local mills. Shipments to cold finishing mills are extremely light, but this may be due partly to continued effort to reduce inventories rather than to the exceptionally light demand for this product. However, the stocks of cold finishers are so low that replenishments in January are almost certain to bring out a considerable tonnage. Prices could hardly be expected to show much strength in such a quiet market, but bars, shapes and plates are still quotable at 1.90c., Pittsburgh, and there is no reason to believe that this figure is being shaded on occasional small lots which are being placed. It is possible that large buyers who might ordinarily enjoy an exceptionally low price are able to do even better in this market, but mills do not consider this business as indicative of generally reduced price levels.

Rails and Track Accessories.—Specifications for track accessories show little change in volume, but some makers are accumulating stocks this month in anticipation of heavy rush orders in January. The carriers may be expected to call for considerable tonnages in very short order, and, by stocking against this probability, it has been possible to keep mills operating at a better rate this month than is justified by the volume of current demand. The Baltimore & Ohio has come into the market for 15,000 kegs of spikes, but has not yet formally inquired for its annual rail requirements. Otherwise, new inquiry is very light, although some roads which buy quarterly are coming into the market for their usual tonnage.

Tubular Goods.—The pipe business is not exempt from the general stagnation in the steel business which has existed for several weeks, and lack of buying has resulted in further curtailment of mill operations. The pipe industry as a whole is not running at more than 50 per cent of theoretical capacity, and with some mills the figure is lower. Shipments to ware-

	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3½ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

houses in the oil country are very light, although some tonnage is moving down the river to distributing points in the Mississippi Valley. The mechanical tubing business looks more promising, as a few automobile companies have entered specifications for January shipments and others are expected to follow in the next two weeks. Pipe prices are holding satisfactorily and the difficulties in maintaining resale quotations, encountered during the summer and early fall, have been largely ironed out.

Wire Products. — Makers of wire products have noticed little change in their business, which continues very slow. Jobbers are placing occasional rush orders for carload lots of nails and wire, indicating closely clipped inventories, but demand for manufacturers' wire is dull and the slight increase in the demands of automobile and auto parts makers is not yet contributing much to the total tonnage. Prices are holding, with nails at $2.40 to $2.50 a keg, Pittsburgh, and bright hard wire at 2.40c. a lb.

Sheets.—Some makers of sheets report a slight increase in business, and operations this week seem to be generally higher than they were in the first two weeks of the month. This is due partly to the fact that a number of mills are cleaning up all possible tonnage with the prospect of practically no operation Christmas week, and partly to the placing of rolling orders by automobile makers. Nearly all of this material is for rush shipment, although a fair amount of tonnage for shipment during January is now reaching company books. The leading interest operated its mills last week at about 60 per cent of theoretical capacity, with the independents at a somewhat lower rate and the industry as a whole at not above 50 per cent. Full finishing mills have been running at about 35 per cent, but this will be improved this week. Prices are subject to strong pressure in the Detroit area, but in this immediate district they seem to be well established at 2.75c., Pittsburgh, for black sheets, 3.40c. to 3.50c. for galvanized, and 2.35c. and 2.20c., respectively, for blue annealed and light plates. The latter quotations apply only to the jobbing mill product, as wide strips are $2 to $4 a ton lower.

Tin Plate. — Tin plate mills are running at about the same rate as they did last week, when the leading interest operated at slightly above 80 per cent and the independents at 60 to 70 per cent. The smaller mills have not been so fortunate in securing anticipated tonnage to keep their mills busy at this time. Current specifications are light. A slight increase occurred at the end of the previous week when February tonnage is supposed to be specified.

Strip Steel. — Mill operations are slightly higher this week, but most of the mills in the district will not operate Christmas week, and the average for the month will be between 25 and 35 per cent of capacity. On the cold-rolled material, these figures will likely prove too high. Specifications from the automobile industry have increased slightly, although in most cases the tonnages are small, and it is evident that the motor car builders are not yet placing orders for heavy production. A good part of this business has come from the Ford Motor Co., which has planned a rather large January schedule, and which, so far as can be ascertained from the maze of conflicting reports in the Detroit territory, is not to be matched by other car builders. The hardware makers are taking a fair tonnage of strip steel, but demand from warehouses is small, and other consuming lines are equally cautious in their buying. Prices are none too strong, but not quotably lower. There is a belief on the part of some that a lower price on hot-rolled material may have been secured by one of the large automobile companies, but the majority of sellers are holding to 1.90c. and 2c., Pittsburgh, on this material. Cold-rolled strip is quoted at 2.75c., Pittsburgh or Cleveland, and subject to occasional shading. Small buyers of both hot and cold-rolled material have entered first quarter contracts at these figures.

Coal and Coke. — A few buyers of furnace coke are showing some interest in their requirements for the first two months of the new year. This may be prompted by their belief that prices may be no lower in January and possibly stronger, if curtailment of production continues. The $2.65, Connellsville, price is still representative of the market, although lower prices are mentioned occasionally. Demand for heating coke is better than it has been, although not particularly good for this season of the year. The foundry grade is dull, with shipments low and new buying light.

Old Material.—The scrap market retains its recent strength, but the heavy melting grade is not quotably higher on the basis of actual sales. Late last week a substantial tonnage was sold to a local consumer at $15.50, and dealers are meeting with difficulty in covering this order at a profit. It is fairly certain that no mill could duplicate this price on a large tonnage of scrap, but some of them are still making offers and would undoubtedly be willing to buy at the present figure for investment purposes. Hydraulic compressed sheets have also been sold during the week at $15.50, and are now quotable on the same basis as steel. Other grades of scrap are quiet, and the market is very limited. Specialties continue strong.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	13.00 to 13.50
Scrap rails	14.00 to 14.50
Compressed sheet steel	15.00 to 15.50
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	17.00 to 17.50
Heavy breakable cast	11.00 to 11.50
No. 2 railroad wrought	15.00 to 15.50
Hvy. steel axle turnings	14.50 to 15.00
Machine shop turnings	10.00 to 10.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	19.50 to 20.50
Railr. coil and leaf springs	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates	20.50 to 21.00
Low phos., light grades	19.50 to 20.50
Low phos., sheet bar crops	20.50 to 21.00
Heavy steel axle turnings	14.50 to 15.00
Electric Furnace Grades:	
Low phos., punchings	18.50 to 19.00
Hvy. steel axle turnings	14.50 to 15.00
Blast Furnace Grades:	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
Rolling Mill Grades:	
Steel car axles	19.50 to 20.50
Cupola Grades:	
No. 1 cast	14.00 to 15.00
Rails 3 ft. and under	17.50 to 18.50

Cement coated nails, per keg	2.95 to 3.05

Steel Corporation Files $13,401,467 Tax Claim

The United States Steel Corporation filed a claim this week of $13,401,467 in the United States Court of Claims, Washington. The Steel Corporation contends that this amount was erroneously collected by the Treasury as the company's liability for income and profit taxes for 1919, owing to faulty computation of capital by the commissioner of internal revenue.

That the use of steel or steel underframe cars in passenger-train service be required, subject to appropriate exceptions, is a renewed recommendation in the annual report of the Interstate Commerce Commission. Also it holds that the use in passenger trains of wooden cars between or in front of steel or steel underframe cars be prohibited.

Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Consumers Interest in Future Needs Growing But Current Steel Demand Is Light—Some Encouraging Factors

CHICAGO, Dec. 17.—Although sentiment in the Chicago iron and steel market is improved, demand for tonnage remains light. Interest in future needs is growing, as indicated by consumers' requests for prices. The total volume of contracts placed is smaller than that of last week, and spot buying, which is strongly under the influence of seasonal conditions, is receding.

However, several encouraging conditions exist. Structural awards and inquiries from a wide territory surrounding Chicago are noticeably larger. Farm implement manufacturers are maintaining a high rate of output of tillage machinery and are now releasing steel against production of harvesting equipment. Efforts by mills to drive in rail releases have been successful, and this tonnage, with specifications for other finished steel products permits ingot output to be held firmly at 65 per cent of capacity. Specifications for plates for pipe manufacture are larger and schedules point to heavier releases.

Closing of formal orders for the 5000 Rock Island cars has released about 75,000 tons of steel, some of which is already on rolling schedules. The Milwaukee road has entered formal requests for prices on 2300 cars and is preparing specifications on 750 stock cars.

Although pressure for lower prices is severe, most steel mill commodities are holding well at current quotations. Plates, shapes and bars are steady at 2c. a lb., Chicago. Some weakness is indicated in prices for nails at several points to the south of Chicago. Black sheets have been sold at $2 a ton below the quotation of a week ago.

Pig Iron.—Until very recently, the daily volume of specifications for Northern pig iron has held above the average of the preceding month. However, in recent days releases have grown lighter under seasonal influences. It long has been the practice for most foundries to close down about one week in the holiday season and, from all appearances, this year will not be an exception. With all merchant stacks in this district lighted, producers are making a surplus of iron and are adding to stocks. Practices in buying have reversed in the week. A short time ago the bulk of sales were for nearby shipment. Lessened needs over the holiday season have brought a sharp recession in spot purchasing, but contracts for the first quarter are showing a marked increase. It is reported that a Southern furnace has named $15 a ton, Birmingham, as the price for iron to be delivered in the South. No announcement has been made as to the course to be taken for Northern delivery.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet. Most contracts for ferromanganese and 50 per cent ferrosilicon have been signed. The spiegeleisen market is dull, with car-lot orders far apart.

Rails and Track Supplies.—Local mills are meeting with success in pressing for releases of standard-section rails as a measure to support the current rate of ingot output. New orders this week total 5000 tons made up of two lots, one for a frog and switch manufacturer and the other for a small Western railroad. Both orders are for early rolling. Little actual inquiry is now before the trade. However, there is still a sizable tonnage to come into this market, the bulk of which is normally bought soon after the turn of the year. It is reported here that the New York Central may close this week for the 14,000 tons of track accessories it has on inquiry. Miscellaneous orders this week total 3000 tons, the bulk of which is for current needs.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Outstanding among fresh inquiries in this market is 8000 tons of cast iron pipe, on which Milwaukee will close bids Dec. 24. Included in this request for prices is 500 tons of 6-in.; 3500 tons of 8-in.; 2500 tons of 12-in. and 1500 tons of 16-in.; also 500 tons of special castings, 100 tons Class D offset castings and 500 hydrants. Detroit, which has an inquiry before the trade for large diameter pipe, is contemplating the purchase of several thousand tons of 6-in. and 8-in. pipe early in January. Several public utilities have taken preliminary figures on 1930 needs.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	1.95c. to 2.10c.

Cement c't'd nails, base per keg	2.75 to 2.95

Structural Material.—In Chicago, this market remains inactive in actual awards but new contracts and fresh inquiry from surrounding territory show substantial increases. Among awards this week is 5500 tons for bridge work at Indianapolis. Steel has been placed for a power house in Nebraska, and several like inquiries, including a large tonnage at Waukegan, Ill., are active. A telephone exchange at San Antonio, Tex., calls for 3000 tons of steel.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Sheets.—Hot mill output in this district is holding at 50 per cent of capacity. The bulk of current business is in carload lots for immediate delivery. Producers are of the opinion that stocks in the hands of users are near the vanishing point. Jobbers are thinking more of the inventory period and have made sharp cuts in the tonnages which they are taking from mills. There is some interest in future needs, which is shown more in requests for prices than in signed contracts. Prices, delivered Chicago, for galvanized sheets are well-established at 3.55c. to 3.65c. a lb., and for blue annealed sheets, 2.35c. Quotations on black sheets are giving ground, and the range is now 2.80c. to 2.90c. For the first time in many months, shipments of galvanized sheets are in larger volume than those of blue annealed. This is explained by the fact that light manufacturers who use blue annealed sheets are cutting orders to match dullness in their activities, whereas distribution of galvanized sheets is in steady volume from lumber yards, hardware retailers and numerous like agencies. Galvanized roofing may be had from stock. Other sheet mill products can be shipped in one to two weeks.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Wire Products.—Producers of wire and wire products report a substantial increase in forward contracts, though the bulk of this tonnage is for wire ropes. Use of wire by the manufacturing trade has increased only in small degree in the last week. In the same period distribution by jobbers has lightened in the part of the country where cold weather has put an end to outdoor work. Additional tonnage taken for the manufacture of new automobile models is practically negligible. Shipments of electrical cables are large, and order books are well filled. New business is brisk, and producers of this commodity fore-

see an active year ahead, as gaged by expansion programs being announced by public utility operating companies.

Cold-Rolled Strip.—Consumers are showing more interest in forward needs. Prices are well established at 2.75c., Cleveland, or 3.05c. delivered Chicago. Shipments show moderate improvement because of slightly larger use by manufacturers of automobiles.

Reinforcing Bars.—Demand for reinforcing bars is practically nil. Prices continue low and, in the absence of attractive projects, dealers are inclined to give more attention to quoting slightly higher base prices for billet steel reinforcing bars out of warehouses. However, no improvement is shown in their willingness to cut extras for design, bending and the like. Prospects for the near future are uncertain. New projects before the trade are few in number and of small aggregate tonnage. Architects are dusting off some old plans for which they now hope money will be available. A moderate amount of road work is coming to dealers from Iowa and Minnesota. Bar bending shops are cutting deeply into backlogs at operating schedules which are lower than a week ago.

Bars.—The soft steel bar market is making a better showing. Specifications in the week are practically double the volume of the previous seven days, and therefore are measurably ahead of shipments. Sales, however, are in moderate volume. The fact that stocks are being held to a low point leads to the conclusion that expansion in releases is a measuring stick of an increase in the rate of consumption. Orders from manufacturers of farm machinery show that a high rate of output is being maintained in tillage machinery departments, and programs now being prepared indicate that the manufacture of harvesting machines will soon be under way. Mild steel bars may be had in seven to 14 days, depending on rolling schedules. Prices are well established at 2c., Chicago. Operations at rail steel bar mills are steady, and current specifications are ample to support this rate. Manufacturers of beds and barn equipment, though ordering frequently and in small lots, are taking quantities that in the aggregate are larger than is customary at this time of the year. Forward buying of fence posts for delivery in the spring is in moderate volume.

Plates. — Encouraging features of the local plate market are larger releases for pipe manufacture, which promise to expand still further in the near future, and the fact that the orders for the Rock Island cars have been formally placed and specifications for the steel are reaching mills. The Burlington Railroad is still undecided whether it will buy 1200 cars or build them in its own shops. It is reported that action on this question may be taken this week. A Texas refiner has placed 1200 tons of tank plates, which will be fabricated in the Southwest. Fresh inquiry for similar work remains light. Deliveries of plates range from one to three weeks, with several universal mills making the most deferred promises.

Bolts, Nuts and Rivets.—Sharp reductions in specifications for these commodities are attributed by the trade to seasonal influences. Farm implement manufacturers are arranging schedules for the production of harvesting equipment. Forward contracting is near an end.

Coke. — Shipments of by-product foundry coke remain at a level slightly higher than the average in November. All ovens in this district are lighted. Forward contracting continues at $8 a ton, local ovens.

Old Material.—The Chicago scrap iron and steel market continues to show added strength, as reflected by the feeling among dealers. There is still a strong urge to complete old orders as fast as possible, and this leads to spirited bidding for available tonnages, with higher prices being paid by brokers. On this score, numerous transactions are turning to losses on dealers' books. Large consumers are standing by, evidently being well satisfied with their stocks and tonnages that are being received from day to day. Some small melters are in need of scrap for business in hand. Inquiry from this source is active, and a few tonnages have been ordered at prices that are higher than those of a week ago. With the first of the year only two weeks away, some users are now making purchases on which they are specifying delivery in the first week in January. The market for brake shoes is more active, with supplies well matched with current demand. This situation is leading to some confusion, as users, after placing orders with dealers, enter the open market and bid against these dealers for available supplies. Consumers' transactions in heavy melting steel are lacking, but this grade is being turned over in large tonnages on dealer trades. The firmer tone in the market is explained by such factors as curtailment of gathering and preparation due to winter weather, dealers' unwillingness to prepare scrap at current low prices, the slowness of scrap production because of the reduced volume of manufacturing, and closer selection, which results from careful inspection by several major consumers.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraul. compressed sheets	11.00 to 11.50
Drop forge flashings	9.75 to 10.25
No. 1 busheling	11.00 to 11.50
Forg'd cast and r'l'd steel carwheels	17.50 to 18.00
Railroad tires, charg. box size	17.50 to 18.00
Railroad leaf springs cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	17.75 to 18.25
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	15.00 to 15.50
Low phos. plates, 12 in. and under	15.00 to 15.50
Blast Furnace Grades:	
Axle turnings	10.50 to 11.00
Cast iron borings	9.25 to 9.75
Short shoveling turnings	9.25 to 9.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	14.50 to 15.00
Cupola Grades:	
Steel rails less than 3 ft.	16.25 to 17.25
Steel rails less than 2 ft.	18.50 to 19.00
Angle bars, steel	15.25 to 15.75
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	16.00 to 16.50
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	17.50 to 18.00
Iron car axles	25.50 to 26.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought	12.00 to 12.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.00 to 12.50
Stove plate	10.50 to 11.00
Grate bars	10.75 to 11.25
Brake shoes	10.25 to 10.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

New York

Pig Iron Sales, at 10,000 Tons, Indicate Urgent Needs as Buyers Are Still Cautious

NEW YORK, Dec. 17.—The pig iron market has an improved tone. Caution still dominates the policy of melters and, with a price incentive lacking, there is nothing resembling a general first quarter buying movement. Despite these facts, the amount of business being booked by sellers is increasing, indicating that foundry stocks are scraping bottom and that new metal is required to fill castings contracts. Most orders are for relatively small lots and until recently many were for prompt shipment, although, with the approach of the year-end shutdown for inventory-taking, purchases for next year now predominate. Considering the character of the buying, sales in this district for the week, at more than 10,000 tons, were impressive. With the completion of inventories, foundry purchases are expected to show further improvement, even if orders are still mainly confined to nearby requirements. In fact, a less conservative attitude on the part of both buyers of castings and melters will be in order. The price situation shows little change and, while it is possible that attractive inquiries might bring out further concessions, the trade is aware that blast furnace stocks have not been permitted to pile up and that curtailment of pig iron production has been drastic. Buffalo foundry iron is available at $17 to $17.50, base furnace, and Southern is still quoted at $13.50 to $14, base Birmingham. Alabama producers have raised quotations in the Birmingham district to $15, furnace, an advance of 50c. a ton, but so far as can be learned no change in prices for Northern deliveries is contemplated. The Worthington Pump & Machinery Corporation is in the market for 750 tons for first quarter delivery at its Holyoke, Mass., and Elmwood Place, Ohio, plants.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.91 to $22.41
*Buff. No. 2, del'd east. N. J.	20.28 to 20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Steel orders have dropped to the lowest point since the decline in buying set in. Moreover, most of the orders of the past week were not only small in tonnage, but in most instances shipment after Jan. 1 was specified. Locally, the structural steel market is the most active of all steel departments. About 20,000 tons of new work was added to the pending list during the week. Revised figures on the Empire State Building call for 52,000 tons of steel, and award of this project is expected shortly. New York district structural fabricators, having taken a large volume of work in October and November, have backlogs that will keep them busy for periods ranging from three to five months. Prices on finished steel products are fairly steady.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.09½c. to 2.14½c.; bar iron, 2.14c.

Warehouse Business.—The larger jobbers have had a slight increase in business in the past week, but among the smaller warehouses buying is still rather limited. Despite the advanced season, there is still some demand for structural steel, especially bar-sized shapes. Although black and galvanized sheets are moderately active, occasional concessions have appeared recently on desirable tonnages.

Cast Iron Pipe.—The United Gas Improvement Co., Philadelphia, is in the market for about 7000 tons of gas pipe, which it intends to purchase this year. The New York Power & Light Corporation, Albany, N. Y., is inquiring for 1500 tons of 4-in. to 24-in. gas pipe. The Federal Water Supply Co., New York, has closed on 1700 tons of 30-in. Class B pipe for Youngstown and Girard, Ohio, with the leading producer and on 750 tons of 18-in. and 24-in. pipe for Salem, Ore., with a Birmingham maker. The Portland Water District, Portland, Me., is about to close on 900 tons of pipe. Manchester, N. H., will open bids Dec. 23 on 750 tons of water pipe and fittings for delivery in the first quarter.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—Shipments on contracts are continuing in most cases without requests for delay, but buying for prompt delivery is light. The coke operation at Swedeland, Pa., which recently began to make foundry grade, is quoting $7.50 a net ton, ovens, the price maintained by the Philadelphia producer. Special brands of beehive coke are unchanged at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44. to New York and Brooklyn. Standard furnace coke is quiet at $2.65 to $2.75 a net ton. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Ferroalloys.—Sellers of ferromanganese, particularly domestic producers, have closed requirement contracts for 1930 with most of their customers. The new price of $100, seaboard, a reduction of $5 a ton from the 1929 quotation, has been well received. Practically all buyers of 50 per cent ferrosilicon have also contracted for their 1930 needs.

Reinforcing Bars.—Business has slowed down somewhat on account of the usual year-end lull, although the number of small lettings has been fair. Several important projects are pending, but action probably will be

postponed until January in most cases. Prices are firm at 2.05c., New York.

Old Material.—Buying prices still show a tendency to decline. No. 1 heavy melting steel is being bought at $14 a ton, delivered eastern Pennsylvania. The consumer at Claymount, Del., which has not been accepting deliveries of heavy melting steel for some weeks, is now receiving shipments on old orders. No. 2 heavy melting steel is inactive, and brokers are paying $11 to $11.25 a ton, delivered Pottsville, Pa., and $11.50 a ton, delivered Phoenixville, Pa. Most grades of railroad scrap are off about 50c. a ton, on the basis of recent small tonnage sales by brokers and by the railroads.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$10.50 to $11.35
Heavy melting steel (yard)	7.50 to 8.00
No. 1 hvy. breakable cast.	9.50 to 10.50
Stove plate (steel works)	8.00
Locomotive grate bars	8.25
Machine shop turnings	7.00 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast fur. or steel works)	7.00 to 7.50
Mixed borings and turnings	6.75 to 7.50
Steel car axles	15.25 to 16.25
Iron car axles	20.50 to 21.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	9.25 to 9.75
Forge fire	8.50 to 9.00
No. 1 railroad wrought	11.50 to 12.50
No. 1 yard wrought, long	10.50 to 11.50
Rails for rolling	10.50 to 11.00
Stove plate (foundry)	8.25 to 8.50
Malleable cast (railroad)	12.50 to 13.00
Cast borings (chemical)	8.50 to 9.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$15.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	13.00
No. 2 cast (radiators, cast boilers, etc.)	12.50

Non-Ferrous Ingot Metal Prices and Orders

CHICAGO, Dec. 14.—The Non-Ferrous Ingot Metal Institute reports average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended Dec. 6 as follows:

Commercial 80-10-10 (1 per cent impurities)	16.652c.
Commercial 78 per cent metal	14.783c.
Commercial 81 per cent metal	15.239c.
Commercial 83 per cent metal	15.368c.
Commercial 85-5-5-5	15.629c.
Commercial No. 1 yellow brass ingot	12.433c.

As there are, as yet, no generally accepted specifications for ingot brass, it must be understood that each item listed is a compilation representing numerous sales of metal known to the trade by the designation shown; but each item, in reality, includes many variations in formulas. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the specifications will be understood to refer to "commercial grades."

Unfilled orders Dec. 1 for brass and bronze ingots and billets, on the books of members of the Non-Ferrous Ingot Metal Institute, amounted to 10,696 net tons.

Cleveland

Moderate Gain in Orders from Automobile Industry—Northern Ohio Mills Increase Ingot Output

CLEVELAND, Dec. 17.—While there has been little change in the volume of steel business during the past week, the improved sentiment is being maintained, and whatever tendency has developed has been toward an improvement. This has been more noticeable in steel bars, both in carbon and alloy steel, than in other products. Some good specifications came from the bolt, nut and rivet manufacturers and from makers of automotive parts. An Ohio manufacturer of automotive equipment purchased approximately 5000 tons of steel bars.

There is a moderate gain in orders from the automotive industry in the Detroit territory, but none of the motor car manufacturers is making extended commitments.

Manufacturers of lower-priced cars evidently are getting in production more rapidly than those making the higher-priced models. The Ford Motor Co. is understood to have a daily schedule of 4500 cars this week, a gain of 700. While unsold stocks of cars have been materially reduced, they are still large enough to cause some manufacturers to keep production down to a low point.

Ingot output by two of the larger independent mills in northern Ohio has increased considerably, these operating now at approximately 60 per cent of capacity.

The only development in the price situation is a reduction of $1 a ton on sheet bars, billets and slabs.

Pig Iron.—Sales declined the past week, during which Cleveland interests sold 9500 tons of foundry and malleable iron. While most of the business was for the first quarter, there were a large number of small prompt shipment orders from foundries that are buying from hand-to-mouth. Foundries in the automotive field are staying out of the market, practically all the contracts placed coming from other industries. The General Electric Co. is inquiring for 300 tons of iron for its Erie works. The Westinghouse Electric & Mfg. Co. has not yet closed against its inquiry for iron for its Cleveland plant for the first quarter. Prices are unchanged and appear firm at $18.50, Cleveland, for out-of-town shipment, $19, furnace, for Cleveland delivery and $19.50 to $20, furnace, for shipment in Michigan. Shipping orders continue light and are not expected to show a gain during the remainder of the month. Two or three foundries in the automotive field that have not been taking iron issued releases during the week. However, there is no general improvement in shipping orders from this source. Most merchant furnaces are adding to their stock piles. The Central Alloy Steel Corporation has blown out its Massillon furnace for relining.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.51 to 20.51
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6.01 from Birmingham.

Fluorspar.—The present $18 price on gravel fluorspar has been reestablished for next year, but, with restricted operations, mills are showing no interest in contracts.

Semi-Finished Steel.—The leading local maker of semi-finished steel has opened its books for the first quarter at $34, Cleveland, Youngstown and Pittsburgh, for sheet bars, billets and slabs and has taken some contracts at this price, which is a $1 a ton reduction from its fourth quarter price. However, the market had shown weakness recently. Youngstown mills are also naming $34 for the first quarter. Wire rods are holding to $40, Cleveland, but not many buyers have closed contracts. A Cleveland mill that slowed down operations to two open-hearth furnaces now has seven furnaces in operation.

Sheets.—Stamping plants are now receiving considerable inquiry from automobile manufacturers for car stampings and have asked mills for prices on sheets for estimating purposes. Releases against tonnages held up several weeks ago have increased, and some of the mills are operating better than they were last month. Independent mills in this territory are running at about 40 per cent of capacity. Current orders continue rather light. Automobile manufacturers are buying only in small lots and are not interested in covering for extended requirements. There is quite an improvement in releases from barrel manufacturers. There is little change in the price situation. Black sheets are fairly firm at 2.75c., Pittsburgh, but shading from regular quotations

Warehouse Prices, f.o.b. Cleveland

Cold-fin. flats and sq	4.15c.
Hoops and bands, No. 12 to 1/4 in., inclusive	3.25c.
Hoops and bands, No. 13 and lighter	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.70c. to 3.90c.
Galvanized sheets (No. 24)	4.60c. to 4.75c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb	$2.65
No. 9 galv. wire, per 100 lb	3.00
Com. wire nails, base per keg	2.65

*Net base, including boxing and cutting to length.

is reported on blue annealed sheets. While some of the continuous mills are naming 2.10c. for No. 10 and 2.25c. for No. 13, these prices are subject to concessions. On galvanized sheets, 3.40c. is a rather common quotation, and some first quarter business has been taken at that price.

Cold-Finished Steel Bars.—While a few consumers making automobile parts are operating a little better than recently, specifications have not increased. The market is firm at 2.20c., Cleveland. Very few contracts have been taken for the first quarter.

Bars, Plates and Shapes.—Specifications for steel bars gained during the week. Plates and structural shapes continue dull. Quite a few first quarter contracts were closed, these being at 1.90c., Cleveland, for steel bars and at 1.90c., Pittsburgh, for plates and shapes. While a 1.85c., Cleveland, price is still in evidence on steel bars, several of the outside mills will not meet this price. Specifications for alloy steel bars have increased, although some forge shops doing automobile work still have good stocks. Some first quarter contracts for alloy steel bars have been taken. Inquiry in the building field is light, and not much activity is expected during the remainder of the year.

Bolts, Nuts and Rivets. — Quite a few buyers have placed contracts for the first quarter since the reestablishment of the present 70 per cent discount. Specifications continue very light. As a result of the recent decline in the demand makers have considerable business on their books that will be cancelled at the end of the year.

Strip Steel. — While specifications for hot and cold-rolled strip are still rather light, orders are coming out in somewhat better volume than during the latter part of November. Most of the business is in specifications against outstanding contracts and consumers are ordering only for immediate needs. Prices on hot-rolled strip appear to be holding fairly well, but new orders are not for sufficient tonnage to test prices. Cold-rolled strip appears firm at 2.75c., Cleveland, efforts to secure a lower price on car lots having proved unsuccessful.

Coke.—The output of domestic coke has been increased following the blowing out of blast furnaces. The demand for heating coke has declined, however, because of the mild weather. While egg coke is quoted at $4.75, Ohio ovens, some price irregularity has developed. Foundry coke is very quiet and prices are unchanged. Ohio by-product foundry coke is quoted at $8.25, ovens.

Old Material.—The market has improved to the extent that mills in the Youngstown district, which for a time took practically no scrap, have released some shipping orders for heavy melting steel and compressed sheet steel. One Cleveland mill is still taking blast furnace scrap. As dealers are well covered, the additional releases have not stimulated buying by them to any extent. The market is weak, and prices on most of the steel-making grades have declined 50c. a ton. Little, if any, buying by mills is expected before January.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	13.00 to 13.50
Compressed sheet steel	12.50 to 13.00
Light bundled sheet stampings	11.50 to 12.00
Drop forge flashings	11.50 to 12.00
Machine shop turnings	9.00 to 9.50
Short shoveling turnings	11.00 to 11.50
No. 1 railroad wrought	13.00 to 13.50
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	12.00 to 12.50
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.00 to 10.50
Mixed borings and short turnings	10.00 to 10.50
No. 2 busheling	10.00 to 10.50
Cupola Grades:	
No. 1 cast	16.00 to 16.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.50
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Philadelphia

Shape and Black Sheet Prices Weaker — Concessions of 50c. to $1 a Ton on Pig Iron

PHILADELPHIA, Dec. 17.—Steel mill operations have receded to the lowest level of the year, and with the fourth quarter drawing to a close, new business is decidedly small. The shape market is inactive and prices have developed a further downward tendency, with recent sales of desirable tonnages at 1.85c. a lb., f.o.b. mill. Black sheet prices are also lacking in firmness when business is for prompt shipment. Automobile manufacturers have been increasing operations and railroad car buying has brought a substantial volume of activity to forging shops on axles and carwheels.

Shipbuilders are bidding on 10 steel barges for the New York, New Haven & Hartford Railroad, and are expecting award early next year of five steel tugboats for the Erie Railroad and two large passenger liners for the Export Steamship Corporation. Award of two large vessels for the United States Lines is delayed pending decision on the recommendation of the shipbuilder that the liners should be built with greater beam than is specified. Shipyards in this district are all well occupied, and one large builder has sufficient business for operation into the fall of 1930.

Pig Iron.—Foundry iron is still nominally quoted at $21 a ton, furnace, but concessions of 50c. a ton are being increasingly offered, and recently reductions of $1 a ton have been granted. Consumers show little interest in contracting for first quarter, evidently preferring to cover their requirements a carload at a time. The York Ice Machinery Co., York, Pa., has closed on a small tonnage of foundry iron; the American Engineering Co., Philadelphia, has purchased a carload of foundry and the Newport News Shipbuilding & Dry Dock Co., a carload of Virginia iron. The American Locomotive Co. has purchased 1000 tons of low phosphorus from an eastern Pennsylvania furnace. Southern iron is still a competitor for tonnage in this district, with sellers quoting $13.50 and $14 a ton, Birmingham district furnace, or $18.50 to $19 a ton, f.o.b. Philadelphia, rail-and-water delivery. Birmingham furnaces are reported to have about 300,000 tons of iron piled, and, with the recent make in excess of sales, are adding to this total.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$20.76 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.26 to 22.26
East. Pa. No. 1X	21.72 to 22.76
Basic (del'd east. Pa.)	19.50 to 19.75
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.00 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—In certain instances, consumers have entered into first quarter contracts at 1.90c., Pittsburgh, or 2.22c., delivered Philadelphia, but

most users are not inclined to make future commitments, preferring to buy small lots of bars as they are needed.

Reinforcing Bars.—The only sizable project in the district at present, 900 tons of bars in the Convention Hall, Philadelphia, has been provisionally awarded to the Concrete Steel Co., pending award of the general contract. Prices show no improvement, with billet steel bars quoted at 1.90c. to 1.95c., Pittsburgh, or 2.22c. to 2.27c., delivered Philadelphia, and the extra for cutting to length usually omitted. Rail steel bars are 1.80c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.12c. to 2.27c., delivered Philadelphia.

Shapes.—New business is limited, and prices have shown a tendency to decline further. On substantial tonnages, mills have quoted 1.85c. a lb., f.o.b. nearest mill to consumer, or 1.91c., delivered Philadelphia, but small lots are still bringing 1.90c. to 1.95c., f.o.b. mill, or 1.96c. to 2.01c., delivered Philadelphia. The larger fabricating shops continue well engaged, but small fabricators are in need of tonnage. The Convention Hall, Philadelphia, requiring 7000 tons, has been provisionally awarded to the Bethlehem Steel Co., pending award of the general contract.

Plates.—Mills are maintaining a fair rate of operation and quoting 2c. a lb., Coatesville, Pa., both for prompt shipment and on first quarter contracts. Local shipbuilders are asking for some substantial plate tonnages, including material for 10 steel barges to be built for the New York, New Haven & Hartford Railroad.

Sheets.—Automobile manufacturers in this district are beginning to increase operating rates, but have not been heavy buyers of sheets. One automobile body builder is executing a contract with the Ford Motor Co., but has been receiving material from the Ford company instead of buying it direct. Blue annealed sheets are still quoted at 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, and blue annealed plates at 2.20c., Pittsburgh, or 2.52c., Philadelphia, with $2 to $4 concessions to automobile body builders and other preferred buyers. Black sheets are being maintained at 2.75c. a lb., Pittsburgh, or 3.07c., Philadelphia, for first quarter contracts, but on small tonnages for early shipment buyers claim to have obtained 2.65c. a lb., Pittsburgh, or 2.97c., Philadelphia. Galvanized sheets are quiet, and the price continues at 3.40c., Pittsburgh, or 3.72c., Philadelphia.

Imports.—In the week ended Dec. 14, 479 tons of chrome ore arrived at this port from Greece and five tons of manganese ore from Germany. Pig iron arrivals consisted of 4002 tons from the United Kingdom and 74 tons from the Netherlands. Only 37 tons of structural shapes was received from Belgium and three tons of steel scrap from the United Kingdom.

Old Material.—A Claymont, Del., user of No. 1 heavy melting steel has closed on about 5000 tons at $14.50 a ton, delivered, and a Pencoyd, Pa., mill has purchased a small lot of No. 2 heavy melting steel at $12.50 a ton, delivered, 50c. lower than a previous purchase of the same grade. Consumer buying is limited, and the trend of prices is still downward.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	$14.50
Scrap T rails	14.00
No. 2 heavy melting steel.	$12.00 to 12.50
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	13.50
Hydraulic compressed, old.	12.00 to 12.50
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	13.50 to 14.00
Railroad grate bars	11.00 to 11.50
Stove plate (for steel works)	11.00 to 11.50
No. 1 low phos., hvy., 0.04% and under	21.00 to 22.00
Couplers and knuckles	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.00
Shafting	19.00
Steel axles	20.00 to 21.00
No. 1 forge fire	13.00 to 13.50
Cast iron carwheels	15.50 to 15.75
No. 1 cast	15.00 to 15.50
Cast borings (for chem. plant)	14.00 to 14.50
Steel rails for rolling	15.50 to 16.00

Research Fellowships at Michigan Mining College

Twelve fellowships, each carrying a stipend of $1,200 with the usual exemption from fees, are to be offered by the Michigan College of Mining and Technology, Houghton, Mich., for the academic year 1930-31. Holders of these fellowships will enroll in the graduate school and be engaged in various problems connected with a general research program on iron and copper resources of northern Michigan. Among the approved subjects are an investigation of drill steel for use in mines, research in physical metallurgy, X-ray analysis, sintering and briquetting of fine ore, and various studies on ore dressing. Further information and special forms may be secured from L. F. Duggan, registrar of the college.

Sharp Drop in Automobile Production

WASHINGTON, Dec. 17.—Making a decline of 162,570, the production of motor vehicles in the United States in November was 217,441 units, against 380,011 in October and was the lowest since December, 1927, with a total of 133,309, according to the Department of Commerce. For the first 11 months of the current year, however, the production of motor vehicles was 5,235,316 units, an increase of 1,110,673 over that for the corresponding period of last year.

Passenger car output in November was 169,309, a decline of 151,018 from that for October, and was the lowest since December, 1927, with a total of 106,083. For the first 11 months of 1929 passenger car production was 4,494,813, against 3,616,179 for the corresponding period of last year, an increase of 878,634.

Production of trucks in November was 46,513, a decline of 12,303 from October and the lowest since December of last year, with a total of 28,123. For the first 11 months of the present year truck output was 724,424, an increase of 221,613 over that for the corresponding period of last year.

Building Porcelain Enameling Plant

Believing that porcelain enameling will be used more and more in connection with pressed steel for parts requiring a permanent, easily cleanable surface, the Youngstown Pressed Steel Co., Youngstown, Ohio, has awarded a general contract to the Austin Co., Cleveland, for the erection of a one-story plant, 60 x 382 ft., for vitreous enameling of pressed steel products. One of the chief products to be vitreous enameled is washing machine tubs. The enameling equipment for the new plant will be furnished by the Porcelain Enamel & Mfg. Co., Baltimore, and the electric furnaces and other electrical equipment by the Westinghouse Electric & Mfg. Co.

Advertisers Elect Officers

At a meeting of the Eastern Industrial Advertisers, Philadelphia, Dec. 13, the following were elected officers for next year: President, Anson B. Harvey, J. E. Rhoads & Son; vice-president, A. M. Robinson, J. G. Brill Co.; secretary, W. R. KortKamp, Dill & Collins Co.; treasurer, L. A. Cleaver, F. W. Dodge Corporation. Directors: N. S. Greensfelder, Hercules Powder Co.; L. D. Waldron, McGraw-Hill Publishing Co.; D. K. Benoliel, International Chemical Co.; W. S. Hays, National Slate Association; T. B. Whitson, James G. Biddle; R. B. Sabin, S. S. White Dental Co.; R. E. Lovekin, R. E. Lovekin Corporation; D. C. Miner, Asbestos Slate & Shingle Co.; F. C. Weber, Keasbey & Mattison Co.

Electric Hoists

Electric hoists ordered in November were 10.6 per cent off in number and 7.2 per cent in value from the amounts for October. Shipments were smaller by 3.7 per cent. The Electric Hoist Manufacturers Association, E. Donald Tolles, 165 Broadway, secretary, will meet at the Hotel McAlpin, New York, Jan. 16.

Wean Engineering Co., Inc., Warren, Ohio, has been appointed agent for the R. D. Wood gas producers in the territory west of Altoona, Pa.

Birmingham

Pig Iron Melters Show No Interest in First Quarter Buying —Producers Advance Price to $15 Base

BIRMINGHAM, Dec. 17.—Alabama producers of pig iron have opened their books for the first quarter at $15, base, for district consumers. The Southern makers have held off longer than usual in announcing the first quarter prices, but consumers have shown very little interest in forward buying. This situation is attributed largely to heavy purchases in the fall and a falling off in the melt of most of the large foundries. Several of the larger melters have announced longer shut-downs for the holiday period than usual and others are reducing operations to a part-time basis. The decline in shipments during the past 10 days is considered the greatest for any similar period in several seasons. Sixteen furnaces have been active throughout this month. Nine of these have been operating on foundry iron, six on basic and one on recarburizing iron. The Roane Iron Co., Rockwood, Tenn., operating one furnace, plans to shut down Jan. 1 for an indefinite period.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Mills continue to experience a good demand in several important lines, including bars, plates, shapes, railroad accessories and steel castings. Those making these products will enter the new year with comfortable backlogs. The Ensley rail mill has tonnage on its books sufficient for several months' operation. Sheet demand has declined further, the past 10 days, with galvanized sheets bearing the bulk of the loss of trade. Mills continue to take first quarter business in all lines at unchanged prices. Structural steel fabricators report a good demand, and important tonnages are in prospect for early next year. New business in reinforcing bars is unusually light. The Tennessee company is working seven open-hearths at Ensley, one less than last week, and six at Fairfield. The Gulf States Steel Co. has been operating all six at Alabama City for some time in order to build up a reserve for operations while the new blooming mill is being installed next month.

Cast Iron Pipe.—Pressure pipe makers report a better feeling in the market. Active buying from municipalities and utilities is expected within the next few weeks. One company increased operations last week from a three to a four-day week. Plants will be closed down this week, but with one or two exceptions operations will be resumed on Dec. 30. Orders last week were for small tonnages. The McWane Cast Iron Pipe Co. booked an order for 10,000 ft. of 4-in. pipe for Bay St. Louis, Miss. Prices are unchanged at $37 to $38.

Old Material.—With the exception of two or three items of steel scrap being taken by the large mills, the market is without activity. General shutdowns for the holiday period, together with efforts to reduce inventories, are expected to keep the market dull until after the turn of the year. Prices are unchanged, and quotations represent nominal values.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	32.00
Iron axles	33.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

St. Louis

Better Buying of Sheets Expected After Inventory Period —Pig Iron and Scrap Markets Dull

ST. LOUIS, Dec. 17.—The pig iron market is unusually quiet, for there is little buying either for prompt shipment or for first quarter. While a few inquiries for first quarter are pending, and it is said that other melters are beginning to think about their next year's requirements, it is not expected there will be any great amount of buying for first quarter. One reason for this is that melters in this district bought heavily during the early fall, when prices were low, and another is that in some instances the melt has not been as heavy as had been expected, with the result that there will be considerable tonnage carried over into the new year. Prices continue firm. Plants catering to the automobile car building and implement industries expect a marked improvement in business after the first of the year. Shipments of pig iron so far this month are said to be below November's volume, although about on a par with last December's shipments.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.42 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—The Granite City Steel Co. reports that, while the volume of incoming sheet business is not entirely satisfactory, an improvement is foreseen, as both jobbers and fabricators are going into the year with exceptionally small stocks, virtually assuring a buying movement after the turn of the year. Demand for galvanized roofing is normally light for this time of year, and no particular improvement is expected until jobbers are ready to place orders for stocks in anticipation of the usual spring demand. Specifications for tin plate are seasonably light, but a healthy demand is expected after Jan. 1. Tank plates are being received in satisfactory volume, as a result of demand from the oil fields and from freight equipment builders. Construction field continues inactive. The only reinforcing bar inquiry of size pending is a section of the River Des Peres project, which will require 2000 tons.

Old Material.—The market for old material continues dull. The three largest consumers in the district of melting grades continue to ask dealers to withhold shipments against contracts in order to hold down their inventories. In some cases, where railroads insist on shipments, the material is laid down in the yards of consumers with the understanding that it is to be paid for when convenient, which makes the dealers' financial problems more difficult. Because of the desire to hold down inventories, it is not likely there will be important buying until after the first of the year. Railroad lists include: Chesapeake & Ohio, 8173 tons; Chicago, Burlington & Quincy, 5620 tons; Missouri - Kansas - Texas, 1830 tons; International-Great Northern, 1000 tons; Louisville & Nashville, 14,440 tons; Wabash, 194 tons; New

Relay. rails 70 lb. and over	26.50 to	29.00

Youngstown

Improved Rolling Mill Schedules This Week

YOUNGSTOWN, Dec. 17.—Steel companies in this district have increased production schedules for this week an average of 10 per cent, bringing the district average to around 55 per cent, against 48 per cent the week before. Departments which are accelerated are open-hearth furnaces, steel pipe, sheets and strips. At Warren, the Republic Iron & Steel Co. is operating this week all three of its strip mills, and such production is the best at any time in the past two months. The Youngstown Sheet & Tube Co. has likewise advanced its schedules to 45 per cent.

At Hubbard, the Sheet & Tube company is operating one of two blast furnaces, and some of the output of this stack is going to the merchant trade. The Struthers Furnace Co. is booked until Feb. 1, and has no present plans of suspending. However, it is likely the stack, a strictly merchant maker, will go down in the early part of next year for repairs.

Steel makers will suspend rolling mills for the most part during Christmas week, though some units will resume Thursday morning after Christmas Day.

Six hot-blast stove linings and two 40,000-cu. ft. disintegrators and eliminators have been ordered from H. A. Brassert & Co., Chicago, by the Jones & Laughlin Steel Corporation. These will be used in connection with the fine gas cleaning program at the Aliquippa plant.

Canada

Canadian National Orders 120,000 Tons of Rails and Nearly 5000 Cars—General Outlook Improved

TORONTO, ONT., Dec. 17.—Although the recent stock market crash brought an aftermath of uncertainty in the iron and steel industry of Canada, recent events have helped to dispel this pessimism, and the outlook is distinctly improved.

Canadian railroads are doing much to help the situation. Announced programs of the Canadian Pacific and Canadian National run into many millions of dollars. The Canadian National has ordered within the week 120,000 tons of rails and nearly 5000 box cars. The rail tonnage was divided between the Dominion Iron & Steel Co., Sydney, N. S., which was awarded 80,000 tons, and the Algoma Steel Corporation, Sault Ste. Marie, Ont., which will furnish the remaining 40,000 tons.

Equipment orders placed by the Canadian National were divided as follows: 2250 50-ton box cars and 25 tank cars to the Canadian Car & Foundry Co.; 1175 50-ton box cars to the National Steel Car Co., Hamilton, Ont., and about 1000 box cars and 200 refrigerator cars to the Eastern Car Co., New Glasgow, N. S. This road is inquiring for 18 Santa Fe type and 15 mountain type locomotives.

The new year will begin auspiciously for Canadian steel mills, locomotive works, car shops and allied industries. The agricultural implement and automobile industries are at the moment weak links in the chain of industrial activity. In these lines, however, there are prospects of improvement early in the new year.

Pig Iron.—Business closed during the week showed a gain, but the improvement was chiefly in orders for future delivery. Some tonnage from the present quarter will be carried over into the new year.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60

Delivered Montreal

No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Old Material.—Renewed activity is beginning to develop in iron and steel scrap. Dealers are of the opinion that there will be a stronger demand for heavy melting steel and turnings in the near future. Dealers are picking up supplies at unchanged buying prices.

Dealers' buying prices:

Per Gross Ton

	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00

Malleable scrap	14.00	....

Cincinnati

Pig Iron Sales Increase Moderately—First Quarter Inquiries Appear—Scrap Market Steadier

CINCINNATI, Dec. 17.—Although the general demand for pig iron in this district continues to be sluggish, a slight increase in the total sales was noticed last week. District furnace representatives reported the sale of approximately 3000 tons. Of this, two orders, one for 400 and the other for 500 tons of Northern foundry iron, from unnamed consumers were the first sizable tonnages to be placed for first quarter. Melters, generally, are inclined to mark time, and no definite buying movement is expected before the first of the year. The remainder of the week's tonnage was in one to two carlots and was chiefly for immediate use. An inquiry has been received from a central Ohio consumer for 1200 tons of Northern foundry iron for first quarter, and the Favorite Stove & Range Co., Piqua, Ohio, is in the market for 300 tons of the same grade of iron, also first quarter. The Roane Iron Co., Rockwood, Tenn., will blow out its stack about Jan. 1. Price schedules are being well maintained, although one Southern furnace is reported to be granting concessions of 50c.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Old Material.—Although new business in scrap is still slow, price sched-

Seamless steel boiler tubes, 2-in	17.50
4-in.	36.00

ules steadied last week, and no changes were made. Dealers are now adhering to the present prices in current purchases, usually taking scrap at the average of the spread. While there is no superabundance of good scrap, dealers report that there is sufficient available to supply specifications on current commitments.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$12.00 to $12.50
Scrap rails for melting	13.00 to 13.50
Loose sheet clippings	8.00 to 8.50
Bundled sheets	10.75 to 11.25
Cast iron borings	8.25 to 8.75
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.50 to 7.00
Rails for rolling	13.50 to 14.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	12.00 to 12.50
Short rails	17.50 to 18.00
Cast iron carwheels	12.00 to 12.50
No. 1 machinery cast	18.50 to 19.00
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Detroit Scrap Unchanged

DETROIT, Dec. 17.—There have been no changes in prices on old material during the past week. With many plants taking inventories, the feeling is that there will be no further decline over the remainder of the month, as scrap production is very low.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$11.50 to $12.00
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automotive cast	11.50 to 12.00
Hydraul. comp. sheets	11.00 to 11.50
Stove plate	9.00 to 9.50
New No. 1 busheling	10.50 to 11.00
Old No. 1 busheling	9.00 to 9.50
Sheet clippings	8.00 to 8.50
Flashings	9.50 to 10.00

To Build Ships for Black Sea Trade

WASHINGTON, Dec. 16.—Six ships of 9400 deadweight tons each, of which four are already under contract, will be built for the American Export Steamship Corporation as the result of a supplemental contract announced last week by Postmaster-General Brown, providing for the extension of the mail service to Black Sea and Mediterranean ports.

Boston

Pig Iron Prices Weaker—Scrap Steadier

BOSTON, Dec. 17.—Prices for Buffalo and east-of-Buffalo iron are weaker. A Massachusetts manufacturer of machinery has purchased 2000 tons of No. 1X and higher silicon iron at a price equivalent to less than $17 a ton, Buffalo, and a Vermont foundry, feeling out the market for 1000 tons of No. 2X, has been offered iron at the equivalent of $17, Buffalo. Smaller tonnages of No. 2X iron were sold the past week on the same basis, and a little business was taken at $17.50. Furnaces pay scant attention to silicon differentials no matter how small the tonnage. Recent transactions include a small tonnage of Indian iron at $21.50 and $21 a ton, on dock here, duty paid, for No. 2X. A Worcester, Mass., foundry is inquiring for 800 to 1200 tons of malleable iron, and a Holyoke, Mass., foundry seeks 300 tons of foundry iron.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$21.91 to	$22.41
*Buffalo, sil. 2.25 to 2.75	21.91 to	22.41
East. Penn., sil. 1.75 to 2.25	22.65 to	23.15
East. Penn., sil. 2.25 to 2.75	23.15 to	23.65
Va., sil. 1.75 to 2.25		25.21
Va., sil. 2.25 to 2.75		25.71
*Ala., sil. 1.75 to 2.25		24.11
*Ala., sil. 2.25 to 2.75		24.61
†Ala., sil. 1.75 to 2.25		20.25
†Ala., sil. 2.25 to 2.75		20.75

Freight rates; $4.91 all rail from Buffalo; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.
†Rail and water rate.

Reinforcing Steel. — Current business in billet steel bars is confined to small lots. Open quotations are 2.61½c. a lb., base, from stock on large tonnages and 3.16c. for small tonnages. The new power house for the Edison Electric Illuminating Co. of Boston will require 100 tons, instead of 200 tons as first reported.

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.

Rivets, structural or boiler	4.50c.
	Per Cent Off List
Machine bolts	50 and 5
Carriage bolts	50 and 5
Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

The market for rail steel bars is quiet at 2.26½c. a lb., base, delivered common Boston freight rate points.

Old Material. — Eastern Pennsylvania steel mills are still holding up shipments of scrap on old contracts, but there apparently is a little more life to the Pittsburgh market, and prices on old material for shipment there appear a little steadier. A Worcester, Mass., mill has dropped its buying price on long bundled skeleton 25c. a ton, but continues to take limited tonnages on No. 1 heavy melting steel at $12.25 a ton, delivered. New England foundries are taking less textile and No. 1 machinery cast than heretofore, but that fact has failed to influence prices.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.50 to $10.00
Scrap T rails	9.00 to 9.75
Scrap girder rails	8.50 to 9.00
No. 1 railroad wrought	10.50 to 10.75
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	5.50 to 6.10
Cast iron borings (steel works and rolling mill)	6.00 to 6.10
Bundled skeleton, long	8.25 to 8.50
Forge flashings	8.00 to 9.00
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	8.50 to 9.00
Shafting	13.50 to 14.00
Steel car axles	15.00 to 15.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	8.50 to 9.00
Rails for rolling	10.50 to 11.00
Cast iron borings, chemical	9.00 to 9.50

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Buffalo

Bethlehem Operations Gain This Week

BUFFALO, Dec. 17.—There has been a good inflow of small pig iron orders, with some fairly sizable buying in the East. One furnace interest has taken 1000 tons of foundry, 1300 tons of foundry and malleable and 500 tons of malleable from New England. No important buying has occurred in the district, although there has been some small covering for January. The 800 tons of foundry and malleable recently purchased by the New York Air Brake Co., was for the first quarter. The price in the East has been shaded. Shipments have declined slightly but are still good. One of the Donner stacks is down for repairs and will be returned to blast on or about Jan. 1.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.00 to 18.00
Lake Superior charcoal	27.28

Finished Steel. — An increase is noted in the operations of the Lackawanna plant of the Bethlehem Steel Co., which now has 15 open-hearths in operation, all of the mills running on single turn and two of them on double turn. Operation at the Donner plant remains about the same. The Seneca Iron & Steel Co. is operating

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb	3.75

at about 50 per cent. A tunnel for the New York State hospital at Newark, N. Y., will require about 100 tons of reinforcing bars.

Old Material.—About the only transaction of interest since the recent purchase by one of the larger mills of a tonnage of No. 1 heavy melting steel at $14 was the purchase of 1000 tons of stove plate at $12.15. Of this, 500 tons was for immediate delivery and 500 tons for delivery after the first of the year. The Michigan Central list, which closed early in the week and came to Buffalo, brought $12.52, Black Rock, net, or $14.02 gross. There is a fairly good demand for specialties, but the foundry grades are extremely quiet.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel.	$14.00
No. 2 heavy melting steel.	12.50
Scrap rails	$14.75 to 15.25
Hydraul. comp. sheets	12.50
Hand bundled sheets	10.50 to 11.00
Drop forge flashings	12.50 to 13.00
No. 1 busheling	12.50
Hvy. steel axle turnings	12.50 to 13.00
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	10.50 to 11.00
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	10.75 to 11.25
Blast Furnace Grades:	
Short mixed borings and turnings	10.75 to 11.25
Cast iron borings	10.75 to 11.25
No. 2 busheling	8.00
Rolling Mill Grades:	
Steel car axles	16.50 to 17.00
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.15
Locomotive grate bars	10.00 to 10.50
Steel rails, 3 ft. and under	17.75 to 18.00
Cast iron carwheels	11.50 to 12.00
Malleable Grades:	
Industrial	16.50 to 17.00
Railroad	16.50 to 17.00
Agricultural	16.50 to 17.00
Special Grades:	
Chemical borings	12.00 to 12.50

Pacific Coast

Steel Demand in West Shows Easing Off

SAN FRANCISCO, Dec. 14, 1929, (*By Air Mail*).—Demand has eased off considerably owing to the approach of the holiday season and the inventory-taking period. Outstanding awards include 1600 tons of plates for a penstock in Vancouver for the British Columbia Electric Railway Co., booked by the Vancouver Engineering Works; 900 tons of structural shapes for an office building on Montgomery Street, San Francisco, placed with McClintic-Marshall Co., and 365 tons of reinforcing bars for the Veterans' Home, Yountville, Cal., secured by the Concrete Engineering Co.

The Miracle Construction Co. took 293 tons of 6 to 10-in. Class B pipe for the improvement of Las Mesa Colony, San Diego, Cal. The United States Pipe & Foundry Co. was low bidder on 139 tons of 4 to 10-in. Class 150 pipe for Modesto, Cal. Bids open on Dec. 19 for 140 tons of 4 to 8-in. Class B pipe for West Salem, Ore.

The U. S. Engineer Office, Sacramento, Cal., has opened bids on 196 tons of ⅜-in. plate for shore pipe.

Pig Iron.—The pig iron market is without change. Current prices appear below.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Gray Iron Institute Names Committee Members

The Gray Iron Institute, Cleveland, has appointed the following committees for 1930:

COST COMMITTEE—John L. Carter, Sacks-Barlow Foundries, Inc., Newark, N. J., chairman; G. E. Finck, Bethlehem Foundry & Machine Co., Bethlehem, Pa.; William J. Grede, Liberty Foundry, Inc., Wauwatosa, Wis.; A. E. Hageboeck, Frank Foundries Corporation, Moline, Ill.; P. E. Rentschler, Hamilton Foundry & Machine Co., Hamilton, Ohio; F. C. Schimpf, Olney Foundry Co., Philadelphia; L. C. Vallier, Buffalo Foundry & Machine Co., Buffalo.

FINANCE AND BUDGET COMMITTEE—H. J. O'Neil, Western Foundry Co., Chicago, chairman; H. S. Chafee, Builders' Iron Foundry, Providence, R. I.; H. R. Lafferty, Red Jacket Mfg. Co., Davenport, Iowa; F. L. Squires, Waterbury Farrel Foundry & Machine Co., Waterbury, Conn.; H. C. Wilson, Cleveland Cooperative Stove Co., Cleveland.

MERCHANDISING COMMITTEE—J. H. Bruce, Bowler Foundry Co., Cleveland, chairman; H. R. Cooke, Olney Foundry Co., Philadelphia; Gerald Hannay, Barnett Foundry & Machine Co., Irvington, N. J.; Don McDaniel, Decatur Casting Co., Hamilton, Ohio; R. R. Monroe, Des Moines Foundry & Machine Co., Des Moines, Iowa; J. H. Pohlmann, J. W. Pohlmann Foundry Co., Buffalo; H. S. Washburn, Plainville Casting Co., Plainville, Conn.

RESEARCH COMMITTEE—B. H. Johnson, Florence Pipe Foundry & Machine Co., Florence, N. J., chairman; H. Bornstein, Deere & Co., Moline, Ill.; J. D. Coltman, Bullard Machine Tool Co., Bridgeport, Conn.; E. J. Lowry, consulting metallurgist, Detroit; R. D. Phelps, Francis & Nygren Foundry Co., Chicago.

TRADE INFORMATION COMMITTEE—Leo J. Ulstead, John C. Kupferle Foundry Co., St. Louis, chairman; Harry Graham, Bond Engineering Works, Toronto, Ont.; W. J. Grede, Liberty Foundry, Inc., Wauwatosa, Wis.; C. B. Magrath, North Western Foundry Co., Chicago, Ill.; Charles S. Parker, Charles Parker Co., Meriden, Conn.; W. E. Stephen, Roberts & Mander Stove Co., Philadelphia.

TRADE PRACTICE COMMITTEE—R. M. Hill, East St. Louis Castings Co., East St. Louis, Ill., chairman; W. J. Maton, Waterbury Farrel Foundry & Machine Co., Waterbury, Conn.; Thomas W. Pangborn, Pangborn Corporation, Hagerstown, Md.; Chester A. Peebles, Stedman's Foundry & Machine Works, Aurora, Ind.; E. L. Wieland, Milwaukee Grey Iron Foundry, Milwaukee.

The personnel of the membership committee will be announced in the near future. Arthur J. Tuscany, manager, states that the standard cost finding system which the cost committee of the institute has been preparing will soon be ready for distribution to members.

Pittsburgh Scrap Dealers Reelect Officers

The Pittsburgh chapter of the Institute of Scrap Iron and Steel, Inc., at its annual meeting held on Dec. 12, reelected present officers. The officers are as follows: Charles Dreifus, Charles Dreifus Co., Pittsburgh, president; Ike Wilkoff, Wilkoff Co., Youngstown, vice-president; I. W. Solomon, Pittsburgh, secretary; Fred W. Wimmer, Hausman & Wimmer Co., Pittsburgh, treasurer.

H. N. Trimble, H. N. Trimble Co., Pittsburgh, was reelected chairman of the executive committee, and other members, with the exception of H. Tuch, United Iron & Metal Co., Pittsburgh, will also serve another year. Mr. Tuch, who retires on account of ill health, is succeeded by J. P. McCann of the same company. Other members of the executive committee are: Jay G. Stephens, Jay G. Stephens Corporation, Pittsburgh; Joseph Jacobson, Luria Brothers & Co., Pittsburgh; Hugh Ruffner, Wellsville Iron & Metal Co., Pittsburgh; and Harry Cohn, A. H. Cohn & Sons, Butler, Pa.

Directors of the Crucible Steel Co. of America have declared a stock dividend of 3 per cent on common stock and have ordered the regular quarterly distribution of $1.25 a share in cash on the common stock, both dividends payable Jan. 31 to holders of record Jan. 15.

Fabricated Structural Steel

With Awards of 51,000 Tons and Inquiries for 42,000 Tons, Market Is Unusually Active

WITH awards of 51,000 tons and inquiries amounting to 42,000 tons in the past week, there are no signs of the usual seasonal letdown in fabricated structural steel. About 70 per cent of the tonnage let in the last seven days will be required for buildings for non-industrial purposes. It is interesting to note that 13,000 tons is for work in Vancouver, B. C. Outstanding among awards were 7000 tons for a hotel at Vancouver, 6800 tons for a Philadelphia convention hall and 5500 tons for a railroad bridge at Indianapolis.

Approximately half of the tonnage on which bids were asked the past week is for construction projects in New York City. Revised plans for the Empire State Building, New York, call for about 52,000 tons of steel, as against the 40,000 tons previously reported. The steel for this building should be awarded the coming week. Awards follow:

MIDDLETOWN, CONN., 250 tons, foundry and boiler house, to an unnamed fabricator.

NEW HAVEN, CONN., 1070 tons, clinic for New Haven hospital, to Levering & Garrigues.

NEW YORK, 1120 tons, addition for Bloomingdale Brothers, to National Bridge Works.

NEW YORK, 565 tons, building at Walnut Avenue and 137th Street, to Reliance Steel Co.

NEW YORK, 1625 tons, Union League Club building, to Levering & Garrigues.

NEW YORK, 1900 tons, apartment building at Central Park West and Sixty-sixth Street, to Hinkle Iron Works.

NEW YORK, 2205 tons, two buildings for Central Hanover Bank & Trust Co., to Hedden Iron Construction Co.

NEW YORK, 965 tons, hotel on Washington Square, to McClintic-Marshall Co.

HOBOKEN, N. J., 365 tons, inspection shed for Delaware, Lackawanna & Western Railroad, to American Bridge Co.

PENNSYLVANIA RAILROAD, 400 tons, bridge at Coatesville, Pa., to American Bridge Co.

PENNSYLVANIA RAILROAD, 135 tons, two bridges, to Shoemaker Bridge Co. and Belmont Iron Works.

BALTIMORE & OHIO RAILROAD, 765 tons, bridge at Ohio Junction, Ohio, to Mount Vernon Bridge Co.

PHILADELPHIA, 6800 tons, convention hall, to Bethlehem Steel Co.

PHILADELPHIA, 2600 tons, bank and office building, Market and Juniper Streets, to American Bridge Co.

RICHMOND, VA., 2000 tons, building for American Tobacco Co., to Richmond Structural Steel Co.

PARKERSBURG, W. VA., 2080 tons, building for Viscose Co., to McClintic-Marshall Co.

YOUNGSTOWN, 335 tons, Erie Railroad grade crossing elimination work, to McClintic-Marshall Co.

INDIANAPOLIS, 5500 tons, bridge for Traction company, to American Bridge Co.

KENOSHA, WIS., 200 tons, building for Snap-On Wrench Co., to Milwaukee Structural Steel Co.

CHICAGO, 1000 tons, Twelfth Street viaduct, to an unnamed bidder.

PONTIAC, ILL., 200 tons, State buildings, to Mississippi Valley Structural Steel Co.

BLOOMINGTON, ILL., 150 tons, institutional building, to Mississippi Valley Structural Steel Co.

TROY, MO., 400 tons, highway bridge, to Vincennes Bridge Co.

DOUGLAS, ARIZ., 500 tons, building for Phelps Dodge Corporation, to St. Louis Structural Steel Co.

PHOENIX, ARIZ., 830 tons, office building on First Street, to McClintic-Marshall Co.

SAN FRANCISCO, 900 tons, office building, Montgomery Street, to McClintic-Marshall Co.

SAN FRANCISCO, 160 tons, shop for Pacific Electric Mfg. Co., to Herrick Iron Works.

SACRAMENTO, CAL., 168 tons, bridge over Corte Madera Creek, to unnamed fabricator.

SAN BERNARDINO, CAL., 104 tons, school auditorium, to Minneapolis Steel & Machinery Co.

LONG BEACH, CAL., 400 tons, sheet steel piling for city, to Steel, Inc.

ANAHEIM, CAL., 210 tons, telephone building, to McClintic-Marshall Co.

SEATTLE, 500 tons, plates, four oil tanks for Sunset Pacific Oil Co., to Steel Tank & Pipe Co.

SEATTLE, 230 tons, plates, pipe line No. 2, Cedar River project, to Beall Tank & Pipe Co.

GRANABY, B. C., 150 tons, plates, mill for Granaby Consolidated Mining Co., to Vancouver Engineering Co.

VANCOUVER, B. C., 400 tons, plates, tanks for British Columbia Wood Preserving Co., to Vancouver Engineering Co.

VANCOUVER, 7000 tons, hotel for Canadian National Railways, to Dominion Bridge Co.

VANCOUVER, 2200 tons, Marine Building, to Dominion Bridge Co.

VANCOUVER, 1800 tons, Royal Bank building, to Dominion Bridge Co.

VANCOUVER, 1600 tons, plates, penstock, British Columbia Electric Railway Co., to Vancouver Engineering Co.

SPENCE, B. C., 460 tons, Thompson River bridge, to Western Bridge Co.

NEW WESTMINSTER, B. C., 100 tons, brewery, to Western Bridge Co.

FAIRBANKS, ALASKA, 150 tons, plates, 36-in. riveted pipe for Fairbanks Exploration Co., to an unnamed bidder.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 52,000 tons, Empire State Building; previously estimated at 40,000 tons.

NEW YORK, 4150 tons, 35-story building at Greenwich and Rector Streets.

NEW YORK, 1350 tons, apartment building at No. 2 Horatio Street.

NEW YORK, 1000 tons, apartment building at Seventy-ninth Street and Amsterdam Avenue.

NEW YORK, 2165 tons, Home for Incurables, at Third Avenue and 181st Street.

NEW YORK, 235 tons, repairs on bridges at Croton water shed.

FOREST HILLS, N. Y., 650 tons, addition to West Side stadium.

PHILADELPHIA, 1000 tons, Midway Theater.

PENNSYLVANIA RAILROAD, 900 tons, two bridges at New Brunswick, N. J.

CINCINNATI, 450 tons, two public schools.

CLEVELAND, 100 tons, Sidway Avenue suspension foot bridge for Nickel Plate Railroad.

DETROIT, 3500 tons, *Detroit News* building.

RACINE, WIS., 300 tons, school.

CHICAGO, 180 tons, warehouse for Edgar T. Ward Sons.

CHISHOLM, MINN., 400 tons, sintering plant.

SAN ANTONIO, TEX., 3000 tons, building for Southwestern Bell Telephone Co.

DENVER, 600 tons, United States Custom House.

VANCOUVER, B. C., 2500 tons, plates, pipe line; bids being taken.

VANCOUVER, 400 tons, pier extension for Canadian National Railways; bids being taken.

SEATTLE, 370 tons, Dumas Bay bridge; general contract to S. A. Moceri.

JORDAN RIVER, B. C., 3000 tons, power house and penstock for British Columbia Electric Co.; bids being taken.

TACOMA, WASH., 300 tons, grain elevator; general contract to Albertson & Cornell.

LOS ANGELES, 1800 tons, office building, Sixth and Flower Streets; bids being taken.

LOS ANGELES, 1400 tons, bakery for Van De Kamps; bids being taken.

SAN JOSE, CAL., 450 tons, hotel; bids being taken.

SAN FRANCISCO, 150 tons, magazine building for Government at Benicia; bids being taken.

SACRAMENTO, CAL., 196 tons, plates, 20-in. shore pipe for United States Engineer Office; bids opened.

Expect Large Car Needs in the First Quarter

Car requirements for shipment of iron and steel products during the first quarter of 1930 will just about equal the requirements in the corresponding quarter of 1929, according to the quarterly estimates of the Allegheny Regional Advisory Board, which covers business in central and western Pennsylvania, eastern Ohio, northern West Virginia and western Maryland.

This forecast, which is based upon shippers' replies to a questionnaire furnished by the board, predicts a decrease of 8 per cent in car requirements for tin plate, and a decrease of 2 per cent for iron and steel scrap. For machinery a 7.2 per cent increase is reported, while castings makers expect a 5.3 per cent increase.

The figures on iron and steel are interesting in view of the fact that the first quarter of 1929 was a period of considerable activity in the steel industry, and, if the prediction is correct, a rapid resumption of business would have to ensue in a short time.

The Ashland, Wis., iron ore docks have terminated the season's activities with a record shipment of 7,620,000 tons, an increase of 1,000,000 tons over loadings in 1928.

Non-Ferrous Metal Markets

Copper Market Has Better Tone—Sharp Decline in Zinc—Tin Advances

NEW YORK, Dec. 17.

Copper.—Despite a large increase in refined copper stocks during November and the lack of interest on the part of consumers, the tone of the market has improved somewhat in the past week and the likelihood of a break in the present price of electrolytic copper, which is 18c., delivered in the Connecticut Valley, has become more remote. Most buyers are still refraining from making purchases, except to take care of current needs. This feeling of hesitancy has been accentuated by the proximity of the year-end inventory period. Moreover, the gain of 38,518 tons in refined stocks, a considerably larger increase than was anticipated, has not enhanced the position of producers. Even though these factors are far from encouraging, they are partially offset by the betterment in operations of brass and copper wire makers, which should soon be reflected in an augmented demand for copper, and by the desire of certain large users to let the present price of copper stand undisturbed. Producers declare also that curtailment of output has got under way and their order books are in such a satisfactory condition that they can go along for an indefinite time without yielding to the insistent urgence of some consumers for lower prices. Business in the foreign market has been generally dull, although there were two days in the last week when sales rose above 2000 tons. Forward buying is virtually at a standstill. Users know that they will not have to pay more for copper after the first of the year, and consequently are waiting until inventories have been taken before filling January and February requirements. Electrolytic copper for export is unchanged at 18.30c., c.i.f. usual European ports. Lake copper is rather sluggish at 18c. to 18.12½c., delivered.

Tin.—Little business was transacted the past week. Yesterday's sales, estimated at 200 to 300 tons, were the largest for the seven-day period, and the market again is quiet today. Practically all of the current orders have been from dealers, consumers having manifested no interest in making further commitments. The market has been flooded with reports of amalgamations and curtailment of output. There is talk in the trade of a consolidation of the Eastern Smelt-

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

Sheet aluminum	11.00c.	13.00c.
Cast aluminum	10.00c.	12.00c.

ing Co., Ltd., Williams-Harvey & Co., Ltd., and Penpoll Tin Smelting Co., Ltd. In London there has been heavy buying on the part of one concern which is thought to represent the new London group. The result has been a sharp advance in the London market which was quoted today at £186 for spot standard, £189 5s. for future standard, and £189 5s. for spot Straits. Despite the fact that American tin consumers have shown little or no interest, the local market has been influenced by the situation in London so that prices moved steadily upward the past week, and spot Straits tin was quoted today at 41.37½c., New York.

Lead.—There has been some fairly good buying for December and January delivery. In a few cases users have inquired for material for shipment in February, but producers are reluctant to quote that far ahead, feeling that possibly by that time there may be an advance in prices. Quotations are steady and unchanged at 6.10c., St. Louis, and 6.25c., New York.

Zinc.—Prime western zinc., which was 6c., East St. Louis, on Dec. 10, dropped during the past week until today it was selling at 5.50c. The decline brought out considerable business after the low mark of 5.50c. had been reached and the opinion in the trade is that the market will become stabilized at that figure.

Antimony.—The nearness of inventory taking has resulted in a featureless market. Chinese metal is quoted today, for both spot and future delivery, at 8.50c., New York, duty paid.

Nickel.—Ingot nickel, in wholesale lots, is quoted at 35c. a lb., shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is priced at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Dec. 17.—Sales of tin in this market have been in sizable volume. Quotations on zinc and antimony are lower. Transactions in the old metal market are few in number and individually small.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 42.75c.; lead, 6.20c.; zinc., 5.75c; in less-than-carload lots, antimony, 9.40c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No 1, 24.50c.; tin foil, 22c.; block tin, 32c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Inquiries Include 2000 Tons for St. Louis Sewer

EIGHTEEN HUNDRED tons of reinforcing steel bars was awarded during the past week. All of the lettings were small, ranging from 100 to 350 tons each. New inquiries which came out totaled 6000 tons, of which 2000 tons is for a sewer at St. Louis. Awards follow:

WASHINGTON, 125 tons; addition to Bellevue Hotel, to John J. Widmeyer, Inc.

CHICAGO, 380 tons, Twelfth Street viaduct, to Kalman Steel Co.

OTTAWA, ILL., 160 tons, hotel, to Concrete Engineering Co.

SACRAMENTO, 365 tons, Veterans' Home at Yountville to Concrete Engineering Co.

SACRAMENTO, 317 tons, highway work in Imperial County; A. M. Peck, Los Angeles, general contractor, steel placed with unnamed bidder.

SAN FRANCISCO, 100 tons, office building on Montgomery Street, to Gunn, Carle & Co.

SAN FRANCISCO, 100 tons, factory for Link-Belt, Meese & Gottfried Co., to Gunn, Carle & Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEWARK, N. Y., 100 tons, tunnel for New York State Hospital; bids in Dec. 19.

PHILADELPHIA, 900 tons, Convention Hall, provisionally awarded to Concrete Steel Co., pending award of general contract.

BALTIMORE, 500 tons, Post Office.

COLUMBUS, OHIO, 300 tons, extension to Scioto-Olentancey interconnecting sewer.

CHICAGO, 440 tons, building for the Pheoll Co.; A. S. Alschuler, architect.

CHICAGO, tonnage not stated, public school at Seventy-second Street and Clyde Avenue.

CHICAGO, tonnage being estimated, building for University of Chicago.

ST. LOUIS, 2000 tons, section F, River Des Peres sewer, for St. Louis Board of Public Service.

PHOENIX, ARIZ., 119 tons, cell house at Florence for State; bids Dec. 16.

SANTA ANA, CAL., 267 tons, bridge on Flower Street and on Santa Ana Boulevard; bids Dec. 16.

TACOMA, WASH., 400 tons, grain elevator; general contract to Albertson & Cornell.

TACOMA, 325 tons, power house No. 2, Lake Cushman project; general contract to Ward Construction Co.

LOS ANGELES, 104 tons for city; bids Dec. 18.

SAN JOSE, CAL., 300 tons, hotel; bids being taken.

RICHMOND, CAL., 550 tons, cannery; bids opened.

OAKLAND, CAL., 100 tons, hotel, Fourteenth and Jackson Streets; bids opened.

PORTLAND, ORE., 206 tons, Rogue River bridge; bids opened.

American Tankers Being Built Abroad

WASHINGTON, Dec. 17.—The Standard Oil Co. of New Jersey has placed orders with foreign yards for the construction of seven tankers, according to a report in the German press transmitted to the Department of Commerce from Hamburg. Three of the tankers are to be built in Germany, two in England, one in Italy and one in Denmark.

Railroad Equipment

Canadian National Railways Buy 4650 Cars

RAILROADS continue active in buying equipment. The purchase of 4650 cars by the Canadian National Railways was the feature of the market the past week. The Louisville & Nashville is expected to inquire soon for 1823 cars, while the Chicago, Milwaukee, St. Paul & Pacific is taking bids on 2300 cars. The Missouri Pacific and the Wabash have each ordered 25 locomotives. The Canadian National Railways are in the market for 33 locomotives and the Van Sweringen roads are reported to be ready to inquire for about 100 locomotives. Details of the week's business follow:

Chicago, Milwaukee, St. Paul & Pacific has inquired for 2300 of the 3350 cars it will buy in the near future. Bids are being taken on 1000 70-ton mill-type gondola cars, 600 50-ton flat cars and 700 box cars. It will soon enter the market for 750 stock cars.

Louisville & Nashville has authorized purchase of the following cars, inquiries for which will be issued shortly: 750 gondola cars, 300 hopper cars, 500 box cars, 250 flat cars, six passenger locomotives, three dining cars, four combination coach and baggage cars, four coaches, two baggage-mail cars, 10 baggage cars.

Chicago, Rock Island & Pacific is inquiring for 10 passenger coaches.

St. Louis-San Francisco has ordered three dining cars from Pullman Car & Mfg. Corporation.

Northern Pacific has ordered nine dining cars from Pullman Car & Mfg. Corporation.

Chicago, Burlington & Quincy is inquiring for 10 gas-electric rail motor cars.

Wabash has ordered three baggage-mail cars from American Car & Foundry Co. and 25 large freight locomotives from the Baldwin Locomotive Works.

Southern Railway is inquiring for 22 steel baggage-mail cars and one postal car.

Canadian National Railways have placed 2250 50-ton box cars and 25 10,000-gal. tank cars with Canadian Car & Foundry Co.; 1175 50-ton box cars with National Steel Car Co.; 200 refrigerator and 1000 box cars with Eastern Car Co. Inquiries are being made for 18 Santa Fe type locomotives and 15 Mountain type locomotives.

Missouri Pacific has purchased 25 locomotives from Lima Locomotive Works, Inc., and is taking prices on 10 coaches, five club cars and four parlor cars.

Van Sweringen interests are figuring on about 100 locomotives, inquiry for which will be out shortly. They will probably cover requirements of the roads controlled by these interests, which include the Nickel Plate, Chesapeake & Ohio, Erie, Pere Marquette and Hocking Valley.

Union Pacific is preparing specifications for 25 passenger locomotives.

Chicago & North Western plans purchase of 200 suburban coaches next year.

Empire Steel Corporation has moved its Chicago office to 520 North Michigan Avenue, room 1626.

PERSONAL

LOUIS C. REIS, who has been made president of the Minnesota Steel Co., Duluth, Minn., as announced in THE IRON AGE, Dec. 12, was born on Jan. 20, 1881, at New Castle, Pa., where he attended both grade and high schools. He served his apprenticeship in the shops of the Pennsylvania Engineering Works in the same city. He then entered the employ of the New Castle Works of Carnegie Steel Co. as a machinist, later being advanced to turn foreman in the machine shop. On May 20, 1913, he became identified with the Minnesota Steel Co. as assistant master mechanic, a position that he held during the period in which the plant was constructed. Shortly after the plant was put into operation, under date of Feb. 1, 1916, he was appointed general master mechanic. On May 1, 1920, he was made general superintendent of the company, and on Sept. 26, 1927, he was elected vice-president, still retaining the position of general superintendent. On Dec. 9, 1929, he was made president and general manager of both the Minnesota Steel Co. and the Morgan Park Co., succeeding the late Samuel B. Sheldon. Mr. Reis has a record of 30 consecutive years of service with United States Steel Corporation plants. Although his father, Charles H. Reis, has not been connected with the steel industry, two of his father's cousins distinguished themselves in important rôles in the Steel Corporation organization. One of them, John Reis, was formerly vice-president of the corporation and president of the Minnesota Steel Co. The other, George L. Reis, was formerly vice-president and general manager of the Minnesota company. Both are now retired, John Reis residing in Montclair, N. J., and George L. Reis in Knoxville, Tenn.

LOUIS C. REIS

—

BERTRAM G. PARKER has been elected president of the Youngstown Foundry & Machine Co., succeeding W. J. WALLIS, who becomes chairman of the board of directors. Mr. Wallis has been head of the company 40 years. Mr. Parker has been with the company 31 years and for the past eight years has been vice-president and general manager.

—

E. B. NICHOLS, heretofore with the Bell Telephone Laboratories, and before that chief engineer of the Victor Talking Machine Co., Camden, N. J., has been appointed chief engineer of the Brown Instrument Co., Philadelphia.

—

H. G. MOUAT has been made Southern district representative, with offices in the Martin Building, Birmingham, for the Clark Controller Co., Cleveland.

—

W. P. WITHEROW, president, Witherow Steel Corporation, Pittsburgh, recently merged with the Donner Steel Co., Buffalo, was elected chairman of the board of the Donner company on Dec. 13. He has been identified with the steel trade for over 20 years.

—

HARRY G. UPHOUSE, who has been manager of the Philadelphia district office of the Donner Steel Co. since 1918, has been transferred to the Buffalo territory. He will have charge of steel and pig iron sales in that district. The Donner company's office in Philadelphia will be closed, and sales will be handled under the direction of the New York office, 120 Broadway, of which P. M. GUBA is district manager of sales.

—

H. G. KESHIAN, metallurgist, Chase Companies, Inc., Waterbury, Conn., will speak on "Deep Etch Test" at the December meeting of the New Haven chapter of the American Society for Steel Treating to be held Dec. 19 at Hammond Laboratory, Yale University.

—

H. D. MATTHEWS, formerly section engineer, Westinghouse Electric & Manufacturing Co., has been appointed consulting engineer for the W. M. Chace Valve Co., Detroit.

—

JOHN M. DAVIE has been made representative in western Pennsylvania and northern Ohio, excepting Toledo and suburbs, by the General Mfg. Co., maker of flexible power presses, Detroit. He has his headquarters at 2453 Overlook Road, Cleveland Heights, Ohio.

—

E. B. JONES, assistant traffic manager of the Norton Co., Worcester, Mass., has been made a director of the Traffic Club of New England.

—

F. A. WHITEHEAD, formerly superintendent of rolling mills for the Copperweld Steel Co., Glassport, Pa., has been appointed general superintendent of that company, a newly created position. S. L. GIBASON, formerly assistant superintendent of rolling mills, has been named superintendent, and has been succeeded by J. C. GLOVER.

—

THORSTEN Y. OLSEN, son of Tinius Olsen, has been elected president of the Tinius Olsen Testing Machinery Co., 500 North Twelfth Street, Philadelphia, succeeding his father, who recently celebrated his eighty-fourth birthday and has retired from active participation in the affairs of the company. Thorsten Olsen has been vice-president of the company for a number of years, having been identified with it since he was graduated from the Sibley College of Engineering at Cornell University in 1903. He is a member of the Society of Automotive Engineers, American Society for Steel Treating, American Society for Testing Materials, Institute of Metals (British), Society of Military Engineers and the Engineers Club of Philadelphia. The retiring head of the company, TINIUS OLSEN, was the organizer of the company and has been the active head for about 50 years. He has long been interested in philanthropic work, especially in the place of his birth, Konigsberg, Norway. In September, 1928, his fellow-townsmen in Konigsberg unveiled a statue of him, in recognition of his work. He has also been knighted by the King of Norway and is a member of the Order of St. Olaf.

THORSTEN Y. OLSEN

—

H. E. YEAGER, formerly in charge of Philadelphia district sales of pig iron for the Donner Steel Co., Buffalo, but for the past year on the steel sales staff of the company in the Buffalo territory, has joined the Philadelphia sales organization of Joseph T. Ryerson & Son, Inc., Chicago.

OBITUARY

JOHN MORRISON HANSEN, chairman of the board of the Standard Steel Car Co., Pittsburgh, died on Dec. 13 at La Rochelle, France, where he was visiting in the interests of the company's plant at that place. Mr. Hansen was born in Butler County, Pa., and had spent his entire life in the Pittsburgh district. He was one of the pioneers of the steel car industry, having become associated with the Pressed Steel Car Co. shortly after his graduation from the Western University of Pennsylvania, now the University of Pittsburgh. He served as chief engineer of the Pressed Steel company, and, when the Standard company was organized in 1902, he became its president. He later became chairman of the board and in recent years had been required to spend considerable time abroad in the interests of the company's foreign plants.

—

DAVID C. KLAUSMEYER, general manager, Cincinnati Bickford Tool Co., died suddenly in Cincinnati, Dec. 6, as was noted in this column in the issue of Dec. 12. The brief sketch there given of his career, starting as apprentice in the Bickford Drill & Tool Co., indicated how much of an authority he was on drilling machinery.

—

WILLIAM H. REA, formerly treasurer of the Mesta Machine Co., Pittsburgh, and for many years active in the roll and rolling mill business, died at his home in Pittsburgh on Dec. 15. He was born in that city 73 years ago, and, after attending Phillips Andover Academy and the Massachusetts Institute of Technology, he joined the Robinson & Rea Mfg. Co., Pittsburgh, of which his father was one of the founders. When that company was merged with the Leechburg Foundry & Machine Co. into what is now the Mesta Machine Co., Mr. Rea became treasurer of the latter. For almost 50 years he served as secretary of the Iron Roll Association, retiring from that position early this year.

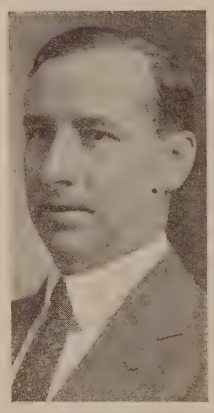
—

FRED D. HOLDSWORTH, formerly engineer in charge of air compressor design at the Claremont, N. H., plant of the Sullivan Machinery Co., Chicago, died Nov. 20, aged 62 years. He had been with the company from 1900 until his retirement in 1928, and had been granted many patents in connection with the development of Sullivan machines.

—

H. G. SEMPLE, for nearly 51 years associated with the Jones & Laughlin Steel Corporation, Pittsburgh, died at his home in Etna, Pa., on Dec. 14. He went to work for the company as a boy of 15, and had been employed in a number of departments prior to his association with sales, which began in 1903. Since 1911 he had been identified with the Pittsburgh city sales department, and was well and favorably known in the steel trade in that district.

J. M. HANSEN



D. C. KLAUSMEYER

—

JOHN D. BIRD, pioneer in the development of Corliss engines and internal combustion engines, died at his home in Milwaukee on Dec. 8, aged 61 years. After leaving high school, he became an apprentice in the plant of Hewes & Phillips Iron Works, Newark, N. J. In 1900 he helped organize Conover & Co., consulting engineers, New York, and 11 years later became general superintendent at the Beloit, Wis., plant of Fairbanks, Morse & Co., where he was engaged in developing light and heavy-duty gasoline and oil engines. In 1907 he became assistant to the works manager of the Worthington works of the International Steam Pump Co., Cudahy, Wis., and two years later was promoted to works manager, continuing in that capacity until the plant was abandoned in 1922. During the war he was president of the Wisconsin Gun Co., Milwaukee.

—

DAVID MILLER, founder and president of the D. Miller Scrap Iron Co. and the De Pere Paper Co., died at his home in Green Bay, Wis., Dec. 9, aged 70 years.

Automobile Production 10 Per Cent Off in 1930

A reduction of less than 10 per cent in 1930 automobile production, as compared with the present year's production, is predicted by *Automotive Industries*, in its annual estimate of future production and sales conditions in the automotive manufacturing industry. The actual figure set by the publication is 4,945,000 units for next year, which will be about 500,000 fewer units than the record-breaking final showing for 1929.

International Licensing Large This Year

HAMBURG, GERMANY, Dec. 2.—Licensing of foreign companies to use German patents affecting the production of steel, non-ferrous metals and machinery has been unusually active this year. In the first nine months, companies in the United States acquired 193 licenses or patents from Germany and German companies bought 107 from American patent holders. Great Britain acquired 192 from Germany and Germany obtained 91 from the British; Belgium secured 103 from Germany and Germany 56 from Belgium; Japan acquired 87 patents or licenses from Germany and disposed of six licenses to German companies.

The Manganese Steel Forge Co., Philadelphia, manufacturer of Rolman screens and other rolled and forged manganese steel products, has discontinued its Cleveland office and the Cleveland district hereafter will be handled by J. H. McKinley, manager of the Pittsburgh office. P. M. Hobbs, formerly in Cleveland, now has charge of the company's Chicago office.

Cleaning steel for porcelain enameling was one of the topics discussed by 110 district managers and representatives of Oakite Products, Inc., New York, who attended the company's twenty-first annual sales conference on Nov. 20, 21, 22 and 23. The reading and discussion of papers were supplemented by practical laboratory experiments to acquaint the men with the new improvements in cleaning methods.

Revival of Iron Mining in Normandy

(Concluded from page 1667)

profitable, perhaps 3000 ft. or so, and along the very extensive outcrops they can be followed, due to repeated folds, for something like 400 miles.

A Rich Iron Ore, High in Phosphorus

On the accompanying sketch map are located all the Armorican mines which have been in activity during 1928 or 1929. There are also noted the two local steel works (at Colombelles near Caën and at Trignac near St. Nazaire), and the export shipping points (Caën, Granville, Nantes and St. Nazaire). The three main mining operations are separately named on this map (Soumont, May and Segre), and the other mines are located by crosses.

Actual shipping grades of the active mines, in carload or cargo lots, are as shown in the accompanying table.

With labor in this district ranging still below $1 per day, costs are naturally also low. My estimate is that a ton of ore on board cars at mine at present costs from 60c. to $1 and will average around 75c. This is a cost of almost exactly 1.5c. per unit of iron.

Selling prices at present are 11 shillings per ton f.o.b. Caën for Norman ores, as against 14 shillings per ton f.o.b. Nantes for Anjou ores. These compare with 20 to 25 shillings c.i.f. British ports for Spanish and Algerian ores of 50 per cent grade, and show that the Armorican field can meet any normal competition.

Output Increasing Rapidly

We can now come to some conclusion as to the probable future and competitive possibilities of this new ore field.

First we may briefly note the total outputs of ore in the Armorican field for certain past years. Modern development of the field dates back only to 1910, while of course the war disorganized its growth, giving unnatural increases in a few years and a serious collapse afterward. The field produced about half a million tons in the depression of 1921; by 1923 the output was somewhat over a million tons; in 1928 it passed 2½ millions. These are, admittedly, not large totals; but the rate of growth which they show is far higher than most other fields during this same period.

Of the total, just about half is used by furnaces in the Armorican region itself; the rest goes to Lorraine and Westphalia. Based on official data for 1928 and my own estimates for 1929 I should say that in these two years the average ore output of the Armorican region was distributed about as follows: 1,250,000 tons by rail to furnaces at Caën and St. Nazaire, 300,000 tons by rail to French furnaces in Lorraine, and 1,000,000 tons by rail and ship to German furnaces in Westphalia, making a total of 2,550,000 tons for 1928, and a similar amount for 1929.

Estimates as to future progress must take into account not only the probable total needs of the world's furnaces in future years, but the relation of the Armorican field to its other great competitors and to its possible markets.

With what we know now about world iron ore reserves, we can safely say that there are existent at least eight great ore fields, in each of which the probable reserve tonnage, figured in any possible way, would range from 1,000,000,000 to 4,000,000,000 tons.

These are tabulated, in order of their annual output, with a few additional data on grades:

Present Output Rank	Developed About	Per Cent Iron	Phosphorus
1. Lake Superior, U. S. A.	1860	50	Low
2. Lorraine, France	1870	35	High
3. Alabama, U. S. A.	1875	35	High
4. Cleveland, England	1860	28	High
5. Armorica, France	1910	50	High
6. Wabana, Newfoundland	1900	50	High
7. Mayari, Cuba	1905	50	Low
8. Brazil	....	60	Low

	Magnetites			Hematites			Roasted Carbonate	Workable Limits
Metallic iron	53.78	53.69	52.5	48.32	48.91	47.94	48.70	46 to 54
Manganese	0.19	0.30	n.d.	0.32	0.30	0.38	0.56	
Phosphorus	0.89	0.96	0.65	0.72	0.72	0.56	0.67	0.5 min.
Sulphur	0.027	0.03	n.d.	0.05	n.d.	0.01	n.d.	
Silica	10.84	11.96	11.0	13.80	15.79	15.71	13.75	8 to 16
Lime	n.d.	2.57	(a)	2.54	3.01	0.08	n.d.	
Magnesia	0.67	0.48	(a)	1.03	1.44	n.d.	n.d.	

(a) Lime plus magnesia is 2.5 per cent.

It will be seen immediately that these eight great ore fields fall into two sharply contrasted classes. On the one hand we have three fields of relatively low-grade ore, but located near to coal fields and to good steel markets; all their ore is consumed locally; they can never export ore of such grades; they tend rather to import higher grade ores for mixtures. These three are Lorraine, Cleveland and Alabama. As contrasted with this we have Lake Superior, Wabana, Armorica, Cuba and Brazil, all having deposits of relatively high-grade ore, all shipping most of their output to distant furnaces located near coal fields or markets. And of these five "exportable" fields, Lake Superior finds its markets in its own country; Cuban ore has certain special difficulties in chemical composition; and Brazil is probably several decades at least from becoming a serious factor in the ore market.

So in the long run the fields whose output will meet in the Atlantic markets of America and Europe are (1) Armorica, (2) Wabana, (3) Scandinavia, (4) North Africa and (5) Spain. With production costs as they are now, Armorica has more than an even chance in any such competition, particularly for the furnaces in Great Britain, Germany and Lorraine. And since its entire output at present is being mined from less than 5 per cent of its workable outcrop, we may fairly expect a continuation of its relatively rapid rate of growth. An annual output of ten to fifteen million tons of Armorican ore could readily be mined and marketed within the next decade; and this will require something more than the present scale of organization.

Engineers Hold Prominent Place in American Life

Of the 28,805 "notable living men and women of the United States" named in "Who's Who in America" (1928-1929), men of science comprise 30.4 per cent, lawyers 15.2 per cent and physicians and surgeons 7.3 per cent, according to L. W. Wallace, executive secretary of the American Engineering Council, Washington, and J. E. Hannum, editor of the Engineering Index Service, New York, in a paper on "Engineers in American Life," presented at the recent annual meeting of the American Society of Mechanical Engineers in New York.

"The 2858 engineers and architects named received 1417 academic degrees in branches of learning other than science, as well as 2497 scientific degrees. They are members of 1138 associations, conference boards, and commissions, half of which are non-technical. They hold 4785 official positions in 3928 organizations, of which number 2993 are industrial and commercial companies. They occupy the position of president in 1128 industrial and commercial organizations, 72 engineering firms, 68 banks and trust companies, and 23 colleges and universities. Among these 2858 engineers and architects there are, or have been, ten governors, 13 members of Congress, two members of the Cabinet, and the President of the United States."

Turning With Shallow Cuts at High Speed

(*Continued from page* 1663)

of the form shown in Fig. 3 was ordinarily used for the trailer.

From three to six tools were tested after each of two grindings for each condition investigated, and the tests were all made in sequence. For example, in the study of the effect of cutting speed on tool performance, one tool was tested at each of the selected speeds in the series, then a second tool was tested at each of the different speeds, and this procedure repeated until the desired number of tools had been tested for each condition. Only average values are used in the comparisons made throughout the report.

The results and conclusions of the tests were summarized by the authors as follows:

With the carbon and high-speed steel tools used, the second tool began to cut when the leader had worn 0.001 to 0.002 in. All subsequent comments on turning with shallow cuts and fine feeds are based on this end point, but greater wear can be made to represent tool failure by using a shallower setting for the second tool than is used for the cutting tool.

Tests were made dry at different cutting speeds, feeds, and depths of cut on nickel-steel forgings with tensile strengths of 80,000 to 100,000 lb. per sq. in. to give a broad background for the interpretation of the results of tests of different tool steels, first heat treated in various ways. The results could be represented approximately by the following equations in which V is the cutting speed, T the tool life, F the feed, D the depth of cut, A the area of cut ($=DF$), and c, K, K_1, K_2, and n are constants.

For high-speed-steel tools,

$$VT^{1/10} = c \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad [1]$$

$$V = K_1 - K_2(DF) = K_1 - K_2A \ldots\ldots \quad [2]$$

For carbon-steel tools,

$$V = \frac{K}{DF} = \frac{K}{A} \quad \ldots\ldots\ldots\ldots \quad [3]$$

These equations are not to be construed to represent the true laws of cutting, since the cutting speed is probably not affected equally by variations in the feed and the depth of cut. However, they represent approximately the results of the experiments made with depths of cut of 0.005 to 0.020 in. and feeds of 0.0115 to 0.0204 in. per revolution.

Coolants Result in Better Finish

In tests of short duration, where tool failure occurred in about 2 to 10 min. the tool life was increased somewhat more by the use of water than by lard oil, but in tests of about 50 min. duration under the same feed and depth of cut but lower cutting speeds, these two liquids produced effects of the same magnitude. The increases in tool life from the use of these liquids were not large in any case, but the finish on the work piece at the end of the cut was better with the liquids than without.

Tests with tools of different forms and angles showed that the successful application of the described method of test was not dependent upon having the broad-nose tool used in a majority of the experiments. Tools with a plan angle of 65 deg. had a longer life than the broad-nose tools, but the finish produced on the nickel steels in dry turning did not appear to be as good. The best tool life in the broad-nose tools was obtained with a back slope of 30 deg.; a side slope of 0 deg. was better than one of 8 deg.

Effect of Composition and Heat Treatment of Tools

The cutting speed of quenched carbon-steel tools was not affected appreciably by variations in carbon content from 0.75 per cent to 1.3 per cent nor by subsequent tempering at temperatures up to 375 deg. Fahr., which did not lower the hardness; the cutting speed of the carbon-steel tools was equal approximately to that of a quenched "oil-hardening" tool steel, and only slightly lower than the cutting speed of a steel containing 1.3 per cent carbon and 2¾ per cent tungsten.

The cutting speed of carbon-steel tools was lower in all cases than that of high-speed-steel tools, but the differences between the two decreased with decrease in the areas of cut in dry turning.

The heat treatments which resulted in the best roughing-tool performance for high-speed steels of customary compositions also resulted in superior performance under shallow cuts and fine feeds. These treatments comprised oil quenching from the highest practical temperatures, followed by tempering to convert the larger part of the retained austenite to martensite.

Of 12 elements added in different proportions to chromium-tungsten or chromium-tungsten-vanadium high-speed steels only one, cobalt, produced decidedly beneficial results. Molybdenum and nickel offered promise under certain conditions, while the remainder either had a negligible effect or were definitely deleterious from one viewpoint or another.

Cobalt Improves Tool Performance

Cobalt improved the performance of the high-speed-steel tools both under shallow cuts and under heavy duty, but the maximum benefits were obtained only with high hardening temperatures. The percentage gain from the addition of cobalt was somewhat greater in rough turning than with shallow cuts and fine feeds, but increase in cobalt above about 5 per cent did not produce improvements commensurate with those resulting from 3.5 to 5 per cent and high hardening temperatures.

Replacement of part or all of the tungsten in high-speed steels by molybdenum, in the ratio of 1 part molybdenum to 2½ parts of tungsten, produced steels having performance comparable to that of the tungsten steels. Such substitution should be useful in case of a depleted tungsten supply, but is not advocated at the present time since there was some evidence of irregular performance in the high-molybdenum steels and their hot-working properties did not seem to be as good as those of the tungsten steels. However, a steel with 7 per cent molybdenum and no tungsten had one advantage over the tungsten steels for roughing tools in that its hardness and performance were not so largely affected by variations in the hardening temperatures.

The addition of 3¾ per cent of nickel to the customary chromium-tungsten-vanadium steels was beneficial for the rough-turning tools, particularly when combined with a 50 deg. Fahr. increase in the hardening temperatures, but was detrimental to the tools used under shallow cuts and fine feeds and adversely affected the machining properties of the high-speed steel itself. Lowering the carbon from 0.6 or 0.7 per cent to 0.5 per cent improved the machining properties without affecting the performance of the roughing tools, but was detrimental to the tools used under shallow cuts.

Effect of Arsenic and Other Elements

Each of the four elements, arsenic, antimony, copper, and tin, adversely affected the tool performance of high-speed steels under shallow cuts, and the magnitude of the decrease became greater as the proportions of these elements increased. Copper was the least harmful; next in order came tin, while arsenic and antimony were the most objectionable.

The effects of these four elements upon the perform-

ance of roughing tools did not necessarily correspond to those observed with shallow cuts. The 0.8 per cent arsenic additions lowered the cutting speed, but the addition of 0.4 per cent antimony or 0.5 per cent or less of tin had no measurable effect. Higher proportions of tin lowered the cutting speeds. The high-speed steels containing 0.36 to 1.77 per cent copper showed slightly better performance than the corresponding steels without copper.

The steels containing 0.4 per cent antimony, 0.8 per cent or more of copper, or 0.8 per cent arsenic did not have good hot-working properties, illustrated by numerous corner cracks on the bars, while those containing 1.7 per cent antimony or 1.8 per cent tin showed a high degree of hot shortness and could not be forged or rolled. Also the steel with 1.77 per cent copper could itself be machined only with difficulty in the annealed condition.

Phosphorus up to about 0.06 per cent and sulphur up to 0.215 per cent did not appear to be injurious, from the viewpoint of lathe-tool performance of the customary chromium-tungsten-vanadium steels, with or without cobalt. However, high sulphur tended to lower the cutting speeds in the presence of 3¾ per cent nickel. Because of the possibility of segregation of the phosphorus and the introduction of numerous sulphide inclusions in high sulphur steels, these two elements can advisedly be kept within low limits for all high-speed-steel lathe tools.

Aluminum Lowers Cutting Speeds

Aluminum adversely affected the performance of the high-speed-steel tools both with shallow cuts and under heavy duty. It was one of the few metals considered which, in proportions around 0.3 per cent, produced a measurable decrease in the cutting speeds in rough turning. This decrease became greater as the proportion of the aluminum was increased, and with 0.8 per cent the drop in cutting speed was greater than that produced by equal proportions of any of the other elements considered. These changes were accompanied by decrease in the hardness of the quenched steels, probably through decrease in the dissolving capacity of the aluminum-iron solid solution for carbon, chromium, tungsten, and vanadium. With 0.8 per cent aluminum there was also evidence of a low-melting eutectic in samples quenched from 2350 deg. Fahr.

Titanium was another of the elements which appeared to lower the dissolving capacity of the austenite, and as a result the hardness and the cutting speeds of the high-speed-steel tools decreased with increase in the titanium. Its interference was lessened, probably through the formation of less harmful carbides, instead of solution as titanium in the austenite, by increasing the carbon content of the steel.

Tantalum did not appear to be promising as a substitute for vanadium or as an alloying element in the customary chromium-tungsten high-speed steels for lathe tools. It acted in a manner similar to aluminum and titanium in that it appeared to decrease the dissolving power of the austenite for the chromium and tungsten compounds and so decreased the hardness and cutting speeds of the quenched lathe tools.

Power Required to Drill Cast Iron and Steel

THE drilling tests presented in the paper by Professor O. W. Boston and C. J. Oxford were on two cast irons, one made up of 20 per cent charcoal pig iron, and 17 different steels selected to cover material commonly used in modern manufacture. Standard twist drills ranging from ½ to 1½ in. were used. The drills were considered sharp in all tests and a coolant consisting of one part soluble oil and 16 parts of water was used in all cases. The scope and some of the conclusions of the test are:

Data as to drilling torque, thrust, computed horsepower at the drill point, and net horsepower supplied to the machine as measured on a recording wattmeter are given under two headings: commercial tests and special tests. All commercial tests were run at a peripheral speed of the drill of approximately 60 ft. per min. The feed for each drill size was as near to those given in the usual commercial-drilling table as the change gears available would permit. They were as follows: 0.009 in. per revolution feed for the ½-in. diameter drill, 0.011 in. for the ⅝-in. drill, 0.012 in. for the ¾-in. drill, 0.013 in. for the 1-in. drill and 0.015 for the 1¼- and 1½-in. drills.

Special tests were run on various cast irons and steels so that the influence of the speed, feed, and drill diameter could be determined, in order that the results of the commercial-drilling tests could be extended to cover any other conditions of drilling for each material. It was found from these special tests that the thrust for both cast iron and steel increased in direct proportion to the drill diameter d; that the torque increased in proportion to d^2 for cast iron and $d^{1.8}$ for steel. The thrust increased with an increase in feed f, but at a rate as slow as $f^{0.6}$ for both cast iron and steel. The torque increased as $f^{0.6}$ for cast iron, but $f^{0.78}$ for steel. It was found that the torque and thrust remained practically constant over the whole range of speeds covered from 74 to 441 r.p.m. for each drill size and feed.

High Speed in Cupola Melting

(*Concluded from page* 1659)

In order to obtain the metallurgical advantage in melting, and more particularly in high-speed melting, it is necessary to maintain a clean cupola. Limestone, mentioned because of its almost universal use, charged on the coke in the ratio of one to four, and with a charge on the bed coke to start off, will flux the cupola cleanly and will not affect the lining unduly. Slag should be removed from the cupola, commencing at the time the third charge reaches the tap hole.

Responses to Many Questions

Following the general presentation of his subject, Mr. Truxell informally answered many questions, some of which are reviewed here. In making high-test iron, where charges in some cases consist of 100 per cent steel scrap, some foundries have made iron with a carbon content as high as 3 per cent. Formerly a very hard, dense coke was regarded as the best, but in the speaker's opinion, a free-burning high-volatile coke is much better. So-called "silvery coke" is not now so highly thought of. A uniform charge in weight is recommended throughout.

That iron should be melted as hot as possible, no matter what kind of casting is to be poured, is the opinion of the speaker. Ingot molds, thus made, will stand up 40 per cent longer. The largest sanitary manufacturer in the country uses 72-in. cupolas and an air pressure of 7 in. Hot iron is poured continuously at the rate of 18 tons per hr. Asked as to whether melting conditions could be determined by the color of smoke issuing from the stack, Mr. Truxell replied, not usually. In response to a query as to whether foundries in general are using too much blast, he answered that as a rule more is used than is necessary.

Closer Affiliation With National Society

A movement which has been considered for some time by the local Philadelphia foundrymen and has been advocated by the officers of the American Foundrymen's Association has finally come to a head. It was announced that Julian Greenstreet, superintendent, Olney Foundry Co., Philadelphia, has been appointed as liaison representative of the local foundrymen to keep in close touch with the activities of the national organization.

Book Reviews

(*Continued from page* 1669)

stead of the broader present curriculum. Forty thousand trained technical men must be recruited before the end of the period, and it is planned to expand the technical evening schools for workingmen. Here, the adoption of the 7-hr. day is viewed as offering tremendous possibilities.

Control of imports constitute an important feature of the five-year plan. Complete elimination of luxuries will be continued, drastic economy in purchases of consumption goods and a corresponding increase in imports of goods for productive purposes. In the five-year period it is planned to spend 6,180,000,000 rubles for imports, of which "equipment for industry and transportation" will cost 1,784,000,000 rubles.

In the appendix a list is given of twenty-five American companies and individuals with which contracts for technical assistance have been closed. Five more have been negotiated since publication of the book. G. S. H.

Buying In a Large and Small Way

Principles of Scientific Purchasing. By Norman F. Harriman. 265 pages, 6 x 9 in., illustrated. McGraw-Hill Book Co., Inc., New York. Price $3.

At the outset the author points out that merchandising, advertising and distribution have attained a degree of importance greater than that of production. The importance of the purchasing function is indicated by the necessity for knowledge of the many processes of which purchasing is the final act. Besides these, there are other factors—technical, market conditions, economic factors, stores control, obsolescence, future requirements, price and business trends. It seems apparent that technical training is regarded with favor by the author.

Economic aspects are based upon or correlated with the elimination of waste and economical operation. Financial features of the purchasing agent's job presuppose such knowledge and alternative sources of supply, discounts, moral standing, payments, and storage costs. Psychology has its place, for in this field are the attitudes and reactions between buyer and seller, strategy, and relations with salesmen.

As to the purchasing agent himself, he is an aggressive, important, practical man and the friend of real value. He is either an engineer or possesses the engineering point of view, a factor which is one of the most significant of our modern business achievements. He possesses courtesy, is eager for ideas which are vital to his business, knows materials, recognizes psychology, and possesses the ability to protect himself. He is fair and earns and maintains the respect and confidence of all with whom he comes in contact. T. W. Buxton.

Commodity Exchanges. By Julius S. Baer and George P. Woodruff. 319 pages, 5 x 8¾ in., illustrated. Harper & Brothers, New York. Price $5.

This is both textbook and reference work, written in clear language by men who understand their subject. One of the authors directed the legal work in connection with four of New York's recently organized exchanges, and the other is a recognized investment analyst. The book supplies a complete description of every phase of the operation of commodity exchanges, and their place in the commercial world. The characteristics common to the various exchanges, the ways in which they differ, and the advantages they offer to all individuals dealing in commodities, are explained in considerable detail.

Describing the evolution of the modern exchange, the authors explain the workings of the "futures contract" and the difference between the cash and futures markets. The work includes a comprehensive discussion of the need for the futures contract in modern distribution, how it should be used by dealers, manufacturers, and others, and how possible evils have been minimized.

Two chapters are devoted to the hedge, which is of paramount importance to dealer, manufacturer, warehouse, and large producer, as a means of price insurance. These chapters present the generally accepted methods of using the hedge to remove business as far as possible from the realm of speculation to a sound merchandising basis.

Auxiliary functions of commodity exchanges may be used to greatest advantage. These functions include the maintenance of grading, weighing and inspection systems, the collection of statistics and the compilation of reports. H. J. Wolf.

Source Book on Industrial History

History of Manufactures in the United States. Vol. II, 566 pages; Vol. III, 467 pages, 6¾ x 10 in. Published for the Carnegie Institution of Washington by McGraw-Hill Book Co., Inc., New York. Price $7.50 for each volume.

Volume I of this important, accurate and readable book was reviewed in The Iron Age September 12. That book carried the subject up to the outbreak of the Civil War; the second and third volumes, now published, contain respectively an account of the years from 1860 to 1893, and from 1893 to 1928.

The year 1861 is very properly chosen as the beginning of a new industrial era, with great political consequences, as the tendency was manifest that "the earth and the fullness thereof" would accrue to the manufacturing nations, whether great, like America and England, or small like Belgium and Switzerland. Attempts were made to create industrial States by allying industry with government. Specialization along national lines became the rule. America stood alone in consuming the greater part of her products; with Europe it was the converse. America carried labor to materials; Europe, materials to labor. With our Civil War and the lessened and partly improvident home market came the northern manufacturers' need to seek foreign markets; in lumber we slashed our home supply in order to glut the marts abroad.

This period made our factory owners dependent on home resources. At first we were long on domestic copper, but so short on domestic coal that return to wood burning for locomotives was suggested. Our entry into Bessemer steel production was late; ship building became active. Our cotton goods supply, plus Great Britain's, was in excess of world demands; but this stimulated wool manufactures.

In the last volume, the author draws a parallel between the economic and business conditions in the years immediately before the Civil War and the World War. According to him, both conflicts began after long periods of subnormal prosperity, and cites statistics from New England to substantiate the thesis. It would appear that conditions were too spotty to warrant the conclusion; some industries were expanding rapidly and some countries were generally prosperous; in America we had passed through Roosevelt's "trust-busting" and another administration hostile to consolidation and integration of manufacture. Robert Grimshaw.

Of Interest to Ocean Shippers

Three recent books on shipping are before us. The first on "Port and Terminal Charges" will be of especial interest to traffic managers, being a comprehensive collection of data prepared by the Corps of Army Engineers and the United States Shipping Board. It may be

had from the Superintendent of Documents, Washington, for $1. It describes the facilities available for ships at the docks of 65 ports in the States and island possessions, and the costs of handling, storage, cartage and switching. From it one can get a close estimate of the total costs of getting a cargo cleared or landed at a certain port.

Similar data but on a much more detailed plan are contained in a 126-page volume on the Port of Galveston and tributary ports, compiled by the same authorities. It contains a number of inserted maps, tables of statistical matter and photographs showing the wharfage and other elements of value to the shipping trade. The waterborne commerce of Galveston has more than doubled since 1917, about two-fifths of which is coastwise.

A comprehensive analysis of the "American Merchant Marine Problem" is contained in a 167-page volume of that title published by the National Industrial Conference Board, New York. (Price $2.50.) Recognizing that the policy of the Government must be a determining factor in the success of a merchant marine, this book picks up the other factors entering into the situation and discusses suggested methods for improving the shipping fleet and its service to the carrying trade of the world. So long as a heavy wage differential makes both the construction and the operation of our vessels unduly expensive, American ships are handicapped in competition with more cheaply built and cheaply run ships.

Governmental assistance in overcoming this persistent differential brings up the question of subsidies and subventions, preferential treatment in railroad rates or discriminating duties. The authors conclude that the Shipping Board should withdraw from the field of ship operation. It is suggested that all of the idle tonnage owned by the Government which is unfit for service might be sold or withdrawn from registry, and held for use only in the event of national emergency. Any additional assistance which may be required to maintain essential shipping facilities under the American flag ought to be provided in accord with sound business principles.

Notes on New Books

Standardization activities of almost every major American industry are described in the 1929 American Standards Year Book published by the American Standards Association, New York. In a foreword, Secretary of Commerce Robert P. Lamont points out that the exchange of goods between countries will be facilitated by standardization of international character. As this exchange is perfected there will be an advance in world living standards through the increased division of wealth. Through the application of industrial standardization the economies of mass production are rapidly extending to consumer goods. This results in wider distribution and consumption of many of those things classed as luxuries.

A proper method of controlling material in process depends upon the scope of manufacturing activities to such an extent that the "storekeeper" may be the purchasing agent (where the raw material is the highest portion of the value, as in a brass foundry), the sales manager (as in a jobbing concern where the critical point is sales), or the production manager (where the mass production of a standard object is the aim). In any event, the economical flow of material in process and the maintenance of the necessary reserve is intimately connected with the most economical method of manufacture and allocation of labor and machines. Consequently a series of nine studies on "Material Control and Storeskeeping in Machine Shops and Foundries" (Willis Wissler, 284 pages, 8½ x 11 in., Ohio State University Press, Columbus, Ohio. Price $2.50) is in reality an intimate study of operations in representative Ohio factories, ranging from those making electrical equipment to others making steam shovels, and as such will serve as a mine of information for manufacturing executives generally.

More than 150 pages are comprised within the 1927 report of the Dominion Bureau of Statistics dealing with the production of iron and steel in Canada during that year, and the output of a considerable variety of finished products using iron and steel as the raw material. The tables go into considerable detail, as the study is essentially that of a census of manufactures. The number of establishments, employees, payrolls, capital investment, cost of materials, value of products and value added in manufacturing find a comprehensive treatment in this publication. Imports and exports, power employed, fuel and electricity used and many other items are covered in the survey.

American Institute of Steel Construction, New York, has prepared a handsome brochure entitled "The Superiority of the Steel Bridge." A brief introduction points out the main reasons for using steel, viz: Strength, permanence, adaptability and economy. But most of the pages are filled with half-tones of notable steel bridges, notable not for their size but for their beauty of line and an architectural treatment harmonious with the surrounding landscape. It is worthy of remark that the majority of these subjects are from European localities—a fact which is not particularly flattering to American constructors.

"Design Standards for Oxwelded Steel and Wrought Iron Piping" forms the subject of a 68-page pamphlet issued by Linde Air Products Co., New York. It should be of especial value to users of large diameter piping, for it gives detailed drawings of acceptable joints, plugs, branches, turns, headers and anchors, together with notes on the advantages and disadvantages of each design, the ordinary uses, commercial tolerances, and appropriate phraseology for specifications. An appendix includes dimension charts for standard flanges for welding, welding necks, a model general specification for a piping installation and a glossary. A supplementary 86-page pamphlet on "Fabrication of Welded Piping Designs" is intended for the shop men and contains sections on procedure control, template work, and cost data.

New Books Received

Psychology and Industrial Efficiency. By Harold E. Burtt. 395 pages, 5½ x 8¼ in., illustrated. D. Appleton & Co., 35 West Thirty-second Street, New York. Price $3.

Machine Design. By P. H. Hyland and J. B. Kommers. 448 pages, 6 x 9¼ in., illustrated. McGraw-Hill Book Co., Inc., 370 Seventh Avenue, New York.

Modern Aviation Engines. Two volumes. By Victor W. Pagé. 1908 pages, 6½ x 9½ in., illustrated. Norman W. Henley Publishing Co., 2 West Forty-fifth Street, New York. Price, for two volumes, $9, for one $5.

Edelguss. Edited by G. Meyersberg. 170 pages, 6¼ x 9¼ in., illustrated. Julius Springer, Linkstrasse 23, Berlin, W 9, Germany. Price 11 m.

American Society for Testing Materials. Tentative Standards: 1929. 901 pages, 6 x 9 in., illustrated. American Society for Testing Materials, 1315 Spruce Street, Philadelphia. Price $8.

General Sales or Turnover Taxation. 204 pages, 6¼ x 9¼ in., illustrated. National Industrial Conference Board, Inc., 247 Park Avenue, New York. Price $2.50.

Gauges and Fine Measurements. By F. H. Rolt. Vol I, 366 pages; vol. II, 357 pages, 6 x 9 in., illustrated. MacMillan Co., 60 Fifth Avenue, New York. Price $14.50.

Dullness Prevails in European Centers

Holidays Affect British Activity—Depression in Germany Partly Offset by Export Trade—Russia a Heavy Buyer in Germany

(*By Cable*)

LONDON, ENGLAND, Dec. 16.

CLEVELAND pig iron producers are benefiting by the reduction of 6d. (12c.) a ton on Durham furnace coke, but are maintaining pig iron prices. The market generally is dull, as domestic consumers are approaching the holidays and the usual stock taking period, and export demand for Cleveland iron is slack.

Hematite furnaces are booked with fair tonnages for first quarter delivery, including a moderate tonnage on Continental account.

Finished steel is quiet, especially for export. Plate and other heavy rolling mills are in need of work.

United Kingdom exports in November were 31,600 tons of pig iron, of which the United States received 2000 tons. Total iron and steel exports were 383,000 tons.

Tin plate is active, with consumers buying for prompt and forward delivery. Works are well sold and prices are likely to advance on an increase in the cost of tin. Galvanized sheets are quiet and prices weak. Black sheets are dull.

Reorganization of Richard Thomas & Co. is expected, following recommendations of the committee appointed to advise on readjustment of the company's capital.

Continental markets are confused, and business difficult to transact. The International Steel Cartel has arranged the first quarter production quota on a basis of the 10 per cent reduction previously agreed upon. The cartel is also establishing an export sales organization for principal products, which includes pooling of orders among mills to give each an adequate share of business. The Charleroi conference of cartel delegates has agreed on minimum f.o.b. prices, but it is now claimed here that sellers are willing to accept lower than these quotations.

The minimum fixed prices are, blooms £4 3s. ($20.25), billets £4 11s. ($22.20) and £4 12s. ($22.45), sheet-bars £4 11s. ($22.20) and £4 13s. ($22.69), merchant bars £5 6s. (1.15c. per lb.) to consumers and £5 5s. (1.14c. per lb.) to merchants, normal shapes £5 (1.09c. per lb.) to consumers and £4 19s. (1.08c. per lb.) to merchants, special shapes £5 1s. (1.10c. per lb.) and £5 2s. (1.11c. per lb.), plates, ¼-in., £6 4s. (1.35c. per lb.), 3/16-in. plates, £6 6s. 6d. (1.37c. per lb.).

German Home Trade Depressed

Steel and Machinery Exports Large and Production For Year May Establish New Post-War Record

BERLIN, GERMANY, Dec. 2.—General business conditions are unsatisfactory, and the usual winter increase in unemployment has been more rapid than a year ago, with the total unemployed estimated at more than one million. Business failures have increased, and in one month 30 small private banks suspended payment. Coal production is larger and the textile and leather industries, which have been depressed, show evidence of improving.

These conditions in the domestic market are, in part, offset by greater export trade, and the past three months have shown an export surplus over imports. This tends to prove that, when Germany ceases borrowing abroad, as has been the case recently, the country can meet its foreign obligations, including reparations payments and loans from the United States, through an active trade balance. The improvement in export trade has not extended to the steel market, where prices have been declining. As a result, the Ingot Steel Syndicate has again increased its rebates to exporting manufacturers and for December is allowing, per metric ton, 16 m. ($3.82) on ingots, 21 m. ($5) on billets and slabs, 36 m. ($8.60) on structural shapes, 34 m.

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.88

British Prices f.o.b. United Kingdom Ports

($8.13) on bars, 42 m. ($10.04) on bands, 21.50 m. ($5.14) on wire rods and 28 m. ($6.69) on heavy-gage sheets.

The refunds to exporting manufacturers are materially aiding such industries to compete for foreign trade with the United States. The cabinet, despite a socialist and free-trade chancellor, is decidedly protectionist in its attitude and among other tariff increases has decided to impose a duty of 250 m. a ton (2.70c. per lb.), on aluminum ingots, at present duty free.

Steel production this year will materially exceed output in 1928 and, with the present rate maintained to the end of December, it should be greater than in 1927, the largest post-war year. From January to October inclusive, steel ingot production was 13,801,328 metric tons, compared with 13,068,045 metric tons in the 10 months of 1928. Production of rolled products was 9,615,349 tons, compared with 9,418,051 tons in 10 months of 1928.

Exports of iron and steel are large, and imports and exports of pig iron have been about equal since spring. The scrap market here is dull, but there is considerable interest in the large increase in scrap exports from the United States, a part of which has been reaching Germany since 1925. In that year only 2 tons of scrap was received from the United States, but in 1928 imports from the United States reached a total of 18,984 tons and in the first seven months of this year were 16,681 tons.

Export sales of machinery and metal goods of nearly all kinds are gaining. Record shipments of certain products were made in October. Germany is increasingly competing in the fields which have been completely dominated by American equipment, such as tabulating machines, typewriters, talking machines and other fine manufactures. A comparison of machinery exports in the first nine months of 1929 with preceding years shows 54,333 machines, valued at 7,430,000 m. ($1,775,770), shipped in nine months of 1926; 40,105 machines, value at 7,399,000 m. ($1,768,361), shipped in 1927; 54,396, valued at 10,134,000 m. ($2,422,026), shipped in 1928; and 73,077, valued at 14,769,000 m. ($3,527,791), shipped in the nine months of this year.

Wire Rod Cartel Raises Tonnage Quota

WASHINGTON, Dec. 14.—At the meeting of International Wire Rod Cartel, Nov. 14, in Düsseldorf prices were left unchanged for the first quarter of 1930, but, in view of an improved market, the tonnage quota was increased from 440,000 metric tons to 475,000 tons. Extension of the cartel beyond April, 1930, was discussed without apparent decision, says a report from Paris to the Department of Commerce.

British Output Less in November

LONDON, ENGLAND, Dec. 13. (*By Cable*).—Pig iron output of Great Britain in November was 631,400 gross tons and that of steel ingots and castings was 815,000 tons. These are the lowest figures for several months, whereas October showed the highest production of the year, in both items.

—

Comparison of recent output with other periods shows that 1929 has provided a higher tonnage, both in pig iron and in steel, than Great Britain has experienced in some years.

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—Av. monthly..	550,900	710,400
1929—Av. first half..	599,600	813,800
1929—August	682,000	753,300
1929—September ...	664,600	847,900
1929—October	688,700	889,800
1929—November	631,400	815,000
1929—Av. 11 months	630,100	817,500

German Works Dismantles Puddled Iron Plant

HAMBURG, GERMANY, Dec. 2.—The Vereinigte Stahlwerke A. G., Düsseldorf, is beginning to dismantle its only remaining plant producing puddled iron, the Siegerlandische Abteilung Ax. The last puddled iron will be produced during the first week of December. Two blast furnaces at the plant will also be dismantled.

To Get French Export and Import Tonnages

Announcement has been made by the Iron and Steel Division, Department of Commerce, that, as a result of efforts of Trade Commissioner Thomas Butts of the Paris office, it will receive from the Comité des Forges de France monthly figures on exports and imports, divided into principal classes of products.

Large German Mills Had Profitable Year

HAMBURG, GERMANY, Dec. 2.—Improved methods in management and administration of German plants have apparently contributed to greater profits this year. Most of the larger steel companies are declaring higher dividends, despite the lockout in the fall of 1928 and the slow improvement in business this year. The Rheinmetall A. G., Klockner works, Hoesch Steel Co. and Gutehoffnungshütte are all paying higher dividends, but the smaller companies as a rule are reducing their dividends 25 to 75 per cent, or are passing them. It is suggested in some quarters that 1930 may see the absorption of many small companies by the leading steel producers. In fact, there are a number of unconfirmed reports of negotiations with that end in view.

Continental Rivets for Export

HAMBURG, GERMANY, Dec. 2.—Competition for rivet business is keen, especially in the export field, where foreign competition is strong. Quotations on ⅞-in. to 1-in. pan, cup, or round head rivets is now about £8 15s. per ton ($1.91 per 100 lb.) and for ½-in. rivets £10 10s. to £10 15s. per ton ($2.28 to $2.34 per 100 lb.), f.o.b. Hamburg or Antwerp, packed in double gunny sacks.

Russia Buying Heavily from Germany

HAMBURG, GERMANY, Dec. 2.—Purchases of iron and steel products by the U. S. S. R. continue large. A recent contract placed with the Kattowitzer A. G. für Bergbau und Hüttenwesen in Upper Silesia calls for steel plates, shapes and wire, to a total value of about 26,000,000 m. ($6,188,000). Under the contract the tonnage may be increased by 50 per cent.

Niles Works in Germany Acquires Two Companies

HAMBURG, GERMANY, Dec. 2.—The Deutsche Nileswerke A. G. of Berlin, controlled by the Niles Tool Works in the United States, has absorbed the Reis & Martin A. G. and Max Hasse & Co., manufacturers of machine tools. The company has declared a dividend of 6 per cent and reports that business, especially for export, has been much larger than in 1928. It has orders on its books for the next four to five months.

Rail Agreement Protested

HAMBURG, GERMANY, Dec. 2.—Rail mills in Belgium and Luxemburg have entered a formal protest with the International Rail Makers' Association against the agreement between Great Britain and Argentina under which the latter will buy British rails exclusively.

Smokeless Diesel Locomotive

HAMBURG, GERMANY, Dec. 2.—A new type of Diesel-engine locomotive, said to be entirely smokeless, has been developed by the Maschinenfabrik Augsburg, Nuremberg, and is being tested by the German railroads. The locomotive develops 1200 hp. and is equipped to absorb all smoke from oil burning.

Machinery Markets and News of the Works

Machine Tool Sales Lag

Substantial Volume of Inquiries Taken as Forerunner of Good January Business

ALTHOUGH the machine tool industry is feeling the effects of the usual year-end lull in buying and of the hesitancy on the part of users to make further major purchases until the future trend of business can be better appraised, sales have been fair in volume and in some centers have exceeded those in December, 1928.

Both manufacturers and dealers find encouragement in the substantial amount of inquiries now before the trade, predicting that a large percentage will be converted into orders early in 1930. If indications in January point to an expansion in business activities, there is little doubt that machine tool bookings will turn upward.

The Maytag Co., Newton, Iowa, has completed the purchase of $175,000 worth of tools, while the Caterpillar Tractor Co., Peoria, Ill., is contracting for machine tools and foundry equipment. The Electric Auto-Lite Co., Toledo, which is building a large extension for the manufacture of automobile lighting and starting equipment, has placed six machines with a Cleveland dealer and will buy considerable more equipment.

The machine tool orders index of the National Machine Tool Builders' Association stood at 178.7 in November, compared with 322.2 for October and 290.4 for November, 1928. The severe drop carried the three months' average trend of the association's index curve down to the lowest point for the year at 247.2 and, in fact, the lowest point since August, 1928.

Shipments in November, however, were somewhat less than in October so that the industry still has more than two months' unfilled orders.

New York

NEW YORK, Dec. 17.—Although buying of machine tools this month has dropped below the November rate, the volume is larger than in December, 1928. Machine tool business in this district has declined to a smaller extent than had been expected. Prospects for the first quarter of 1930 continue to be encouraging. A considerable number of inquiries are pending, and it is expected that a good deal of this business will be closed in January if indications then point to an upward trend in business activity.

Crest Mfg. Co., Inc., 108 West Twenty-fifth Street, New York, manufacturer of plumbing and heating equipment, has leased three-story factory at Long Island City for new plant, and will remove to new location.

Department of Parks, Arsenal Building, Central Park, New York, has plans for two one-story equipment service, repair and storage buildings, 30 x 115 ft., at Long Island City, to cost about $70,000 with equipment.

Erie Railroad Co., 50 Church Street, New York, plans rebuilding of wheel shops and other service buildings at repair plant at Port Jervis, N. Y., destroyed by fire Dec. 9.

Battery Operating Co., 49 West Sixty-sixth Street, New York, has plans by Julius Eckmann, 155 East Forty-second Street, architect, for a six-story automobile service, repair and garage building, to cost about $100,000 with equipment.

R. Hoe & Co., Inc., East River and 138th Street, New York, manufacturer of printing presses and parts, saws, etc., has filed plans for three-story addition, 79 x 137 ft., to cost about $125,000 with equipment. Frank S. Parker, 119 West Fifty-seventh Street, is architect and engineer.

National Lead Co., 111 Broadway, New York, has formed National Lead Co. of Canada, Ltd., a subsidiary, to take over and consolidate several properties in Dominion. New company will be affiliated with Hoyt Metal Co. of Canada, Ltd., Montreal, also a subsidiary of parent organization. Company is capitalized at $5,000,000. W. C. Beschorman, vice-president of parent organization, will be president of Canadian company.

I. Kallich, 26 Court Street, Brooklyn, architect, will soon take bids for a multi-story automobile service, repair and garage building at Coney Island Avenue and Quentin Road, to cost about $130,000 with equipment.

Toledo Scale Co., Toledo, Ohio, has leased floor in building now in course of erection at 801 Second Avenue, totaling 7500 sq. ft. floor space, for new factory branch and service department.

Pilot Radio & Tube Corporation, 323 Berry Street, Brooklyn, manufacturer of radio tubes and equipment, is arranging for consolidation of all plants at Lawrence, Mass., where local mill, totaling 1,500,000 sq. ft. floor space, was recently taken over.

John A. Marshall, Yonkers, N. Y., and Herbert Peterson, Woodhaven, L. I., have organized General Tin Industries, Inc., with capital of 2,500,000 shares of stock, no par value, and plan early establishment of plant in this vicinity; a metal and ore-treating unit will form part of new works.

Consolidated Instrument Co. of America, Inc., 305 East Forty-seventh Street, New York, has taken over property of Connecticut Telephone & Electric Co., Meriden, Conn., manufacturer of telephone apparatus, electrical instruments, etc., with two plants, both of which will be continued by new owner, which will operate Connecticut company as separate division. Company is also negotiating for a plant on Pacific Coast, and will carry out an expansion in that district. Herbert E. Linden is vice-president.

E. T. Cunningham, Inc., 370 Orange Street, Newark, manufacturer of radio tubes and equipment, has leased part of six-story factory at Johnson and Hillside Avenues and Peddie Street for a branch plant. Present works will be continued and, with new plant, about 60,000 sq. ft. of space will be used for production and distribution.

Positive Lock Washer Co., Avenue A, Newark, has taken bids for a two-story addition, to cost more than $40,000 with equipment. Raymond B. Flatt, 600 Bloomfield Avenue, Bloomfield, N. J., is architect.

Engraving & Engine Turning Co., Newark, recently organized by Oscar A. Von Buckow, has leased space at 149 Mulberry Street for a metal turning and etching works.

Board of Township Commissioners, Municipal Building, North Bergen, N. J., will take bids at once for three-story automobile service, repair and garage building, 90 x 112 ft., to cost about $140,000 with equipment. R. B. Glenn, address noted, is architect and engineer for board.

Alfred Hofmann, Inc., 629-35 Fifteenth Street, West New York, N. J., manufacturer of knitting machinery and parts, has superstructure under way for two-story addition, 103 x 125 ft., to cost over $60,000 with equipment. Lockwood Greene Engineers, Inc., 1 Pershing Square, New York, is architect and engineer.

Felco Mfg. Co., Inc., 17 William Street, Newark, manufacturer of steel cabinets, etc., has leased a two-story factory at Bloomfield, N. J., for new plant, and will remove to new location and increase capacity.

Buffalo

BUFFALO, Dec. 16.—United States Gypsum Co., 300 West Adams Street, Chicago, manufacturer of wallboard, cement plasters, gypsum lath, etc., has purchased Niagara Gypsum Co., Oakfield, N. Y., with plant adjoining a branch mill of purchasing company. New owner will consolidate acquired interest with organization, and will organize Niagara & Peerless Division for expansion in Oakfield district.

Camillus Cutlery Co., Camillus, N. Y., is considering erection of an addition, to cost about $40,000 with equipment.

Niagara Lead Co., Mill Street, East Lockport, N. Y., is planning replacement of part of mill destroyed by fire Dec. 12, with loss of about $60,000 including equipment. It is proposed to lease an existing factory for manufacture. Charles A. Johnson is president.

Marco Pagano, 32 Decker Street, Buffalo, and associates have organized M-P Metal Casting Co., with capital of $25,000, and plan operation of foundry for production of metal toys, novelties, etc. Eugene E. Burger, 200 LaSalle Street, is interested in new company.

A. & J. Mfg. Co., Binghamton, N. Y., manufacturer of kitchen tools and equipment, is considering one-story addition to plant on Noyes Island, to cost more than $50,000 with equipment. Company is affiliated with Edward Katzinger Co., 1949 North Cicero Avenue, Chicago, manufacturer of bakers' and confectioners' machinery, tinware, etc. E. H. Johnson is local manager.

Roy W. Whipple, 99 Oak Street, and Thornton D. Whipple, 46 Laurel Avenue, Binghamton, have organized Whipple's, Inc., with capital of $400,000, to operate a local plant for manufacture of automobile equipment and accessories.

Universal Bearing Metals Corporation, Rochester, N. Y., manufacturer of bearium bronze and bearium alloys, has bought assets, processes and patents of Bearium Bearings, Inc. Operating and sales force of latter will not be changed. E. P. Langworthy is president of Universal company.

Wright-Hibbard Industrial Electric Truck Co., Inc., Phelps, N. Y., is about to increase production by installation of new equipment involving an expenditure of about $50,000. Company desires representatives in different states who are familiar with material handling equipment, especially industrial electric trucks.

Philadelphia

PHILADELPHIA, Dec. 16.—Bids have been asked on general contract by Swift & Co., Ninth Street and Girard Avenue, Philadelphia, meat packers, for a three-story and basement addition, to cost over $85,000 with equipment. Company engineering department is in charge. Headquarters are at Chicago.

Philadelphia Rapid Transit Co., Mitten Building, Philadelphia, plans new shops on property recently acquired by Transit Land Co., a subsidiary, to cost more than $85,000.

Shell Eastern Petroleum Products Co., Elverson Building, Philadelphia, has taken over former plant of Philadelphia Rubber Works, 600 x 800 ft., as site for storage and distributing plant, to cost about $125,000 with equipment. Headquarters are at 122 East Forty-second Street, New York.

The Crane Market

ESTIMATING inquiries for use in making appropriations for next year continue to accumulate from the railroads and large industrial users of cranes. Although formal inquiries for overhead equipment have decreased this month, some projects, which have been pending for a number of weeks, have been revived. New business includes a number of small capacity overhead cranes. Contractors bidding for a project of the Westchester County Sanitary Sewer Commission, Yonkers, N. Y., have been obtaining prices on a 5-ton, 60-ft. span, 3-motor overhead crane and a 3-ton, 49-ft. span, grab bucket crane. Railroads have been especially active in seeking estimates on the cost of locomotive cranes for use in making 1930 budgets. The Boston & Albany Railroad, Boston, is about to close on a 20-ton locomotive crane.

Among recent purchases are:

Lebanon Steel Foundries, Lebanon, Pa., two 7½-ton, 50-ft. span overhead cranes, and a 3-ton, double-hook, high-speed electric hoist from Shepard Niles Crane & Hoist Corporation.

Levering & Garrigues Co., 552 West Twenty-third Street, New York, 10-ton, 75-ft. span crane for yard service at Dunellen, N. J., from Milwaukee Electric Crane & Mfg. Corporation.

United States Rubber Co., Providence, R. I., 15-ton and 5-ton electric traveling cranes from unnamed builder.

Congdon & Carpenter, Providence, R. I., 3-ton, 52-ft. span and 5-ton, 67-ft. span electric cranes from Shepard Niles Crane & Hoist Corporation.

General Electric Co., Lynn, Mass., 3-ton overhead electric crane, reported purchased from Shepard Electric Crane & Hoist Corporation.

Gimbel Brothers, Ninth and Market Streets, Philadelphia, will soon take new bids on revised plans for a two-story automobile service, repair and garage building for company motor trucks and cars, to cost $170,000 with equipment. Abbott, Merkt & Co., 178 Fifth Avenue, New York, are architects.

Philadelphia Electric Co., Ninth and Sansom Streets, Philadelphia, has plans for one-story equipment storage, repair and distributing plant at West Conshohocken, Pa., to cost about $60,000 with equipment. United Engineers & Constructors, Inc., 112 North Broad Street, Philadelphia, is architect and engineer.

Board of Education, Administration Building, Allentown, Pa., is considering installation of manual training equipment in three-story addition to Raub junior high school, to cost about $225,000, for which bids will be asked on general contract early next year. Jacoby & Everett, Commonwealth Building, are architects.

Coatesville Boiler Works, Inc., Coatesville, Pa., is planning one-story addition to foundry in Drumpelier district, to cost more than $75,000 with equipment.

Harrisburg Railways Co., Harrisburg, Pa., is planning expansion program to cost about $350,000, including track work, shop facilities, etc.

Susquehanna Pipe Line Co., care of J. Howard Pew, Ardmore, Pa., recently formed by Mr. Pew and associates, has applied for permission to construct and operate a pipe line from Elizabethtown to York, Pa., including establishment of oil storage and distributing plant to connect with system. Frank Cross, Merchantville, N. J., is also interested in new company.

New England

BOSTON, Dec. 16.—Dealers' sales of machine tools the past week were again quite limited. No new inquiries of importance have developed, and buying on old prospects apparently has been put off until after Jan. 1. The majority of New England machine tool builders have sufficient backlogs to keep plants on current operating schedules through the first quarter.

New England Smelting Works, Inc., West Springfield, Mass., is arranging for new plant to replace one recently destroyed by fire.

National Service Co., Fall River, Mass., early next year will build an artificial ice making plant for which miscellaneous equipment will be purchased.

Manning-Bowman & Co., Meriden, Conn., have plans for a new factory to be erected early next year.

Malden Machine Tool Co., Malden, Mass., closed bids last week for a machine shop, to cost $30,000 without equipment.

M. H. Barland Steam Engine Co., Providence, R. I., will start work at once on a one-story plant, 50 x 60 ft.

Central Maine Power Co., Augusta, Me., has engaged J. C. & J. M. Stevens, architects, to draw plans for a power station at Bingham.

Boston & Albany Railroad Co., South Station, Boston, has awarded general contract to J. F. Fitzgerald Construction Co., 38 Chauncy Street, for power plant at Beacon Park, Allston, to cost about $85,000. Densmore, LeClear & Robbins, 31 St. James Avenue, Boston, are architects.

Newark Rivet Works, 262 Lafayette Street, Newark, N. J., has purchased wire goods department of Bassett Metal Goods Co., Shelton, Conn., which sold its metal bag frame division to same company about six months ago. Purchasing organization will operate both departments at present location and will carry out expansion later.

G. & O. Mfg. Co., 138 Winchester Avenue, New Haven, Conn., manufacturer of automobile radiators, has asked bids on general contract for a two-story addition, 40 x 100 ft., for manufacture of aircraft radiators, to cost about $45,000 with machinery. Westcott & Mapes, 139 Orange Street, are architects and engineers.

Great Atlantic & Pacific Tea Co., 420 Lexington Avenue, New York, has plans for addition to storage and distributing plant at Portland, Me., with cold storage and refrigerating facilities, mechanical-handling and elevating equipment, to cost $170,000 with equipment.

Storts Welding Co., South Colony and Hanover Streets, Meriden, Conn., is considering one-story addition, to cost more than $30,000 with equipment, work to begin in spring. R. J. Tierney is general manager.

George Lawley & Sons Corporation, operating a shipyard and repair plant at Dorchester, Boston, plans rebuilding part of shops destroyed by fire Dec. 10, with loss estimated close to $100,000 including equipment.

Cadillac Providence Co., 9 Federal Street, Providence, R. I., has asked bids

on general contract for two-story service, repair and sales building, to cost $140,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Pittsburgh

PITTSBURGH, Dec. 16.—The machinery business has not changed materially the past week and is very quiet with most dealers. December ordinarily is not a good month with many of them and this year is no exception. A few single tools are being placed, but new inquiries are not coming out in any volume and not much of the business now being figured will be placed before the first of the year. The Norfolk & Western closed for one or two tools the past week and is expected to be a heavier buyer within the next few weeks. The Baltimore & Ohio has not yet closed on the tools it has under inquiry, but the business is said to be settled. The fourth quarter list of the Westinghouse Electric & Mfg. Co. is now practically concluded, but a new list will appear in a short time.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has awarded general contract to Public Service Production Co., Public Service Terminal, Newark, N. J., for initial unit of new factory branch, storage and distributing plant near Port Newark, to cost over $600,000 with equipment. Other structures will be built later to bring investment to more than $5,000,000. Company recently acquired 20 acre tract at location noted.

United Engineering & Foundry Co., Farmers' Bank Building, Pittsburgh, manufacturer of iron and metal-working machinery, is carrying out an improvement and modernization program at branch plant at Canton, Ohio, to include installation of additional equipment.

Oliver Iron & Steel Corporation, 1001 Muriel Street, Pittsburgh, has awarded general contract to Pihl & Miller, Wabash Building, for one-story addition, to cost about $40,000 with equipment.

Pittsburgh & Lake Erie Railroad Co., P. & L. E. Terminal Building, Pittsburgh, is asking bids until Dec. 27 for 6600 pieces of seamless steel tubing. J. H. James is purchasing agent.

Harpers Ferry Electric & Power Co., Harpers Ferry, W. Va., is arranging for expansion to cost about $250,000, including increase in power facilities, transmission lines and power substations.

J. H. France Refractories Co., Snow Shoe, Pa., will soon begin work on new plant at Falls Creek, Pa., consisting of main one-story kiln building, 100 x 450 ft.; mixing unit, 30 x 40 ft.; press building, 20 x 60 ft.; storage and other buildings, to cost about $325,000 with equipment.

Detroit

DETROIT, Dec. 16.—Standard Tube & Mfg. Co., 2435 Scotten Street, Detroit, manufacturer of metal tubing and kindred products, is considering new one-story plant at Ferndale, Mich., to cost more than $50,000 with equipment.

Hayes Body Corporation, Grand Rapids, Mich., has plans for a one-story addition, 175 x 565 ft., for stamping metal bodies, to cost $250,000 with equipment. Fett, Pearson & Goffeney, Associates Building, South Bend, Ind., are architects.

Oliver Machinery Co., Grand Rapids, manufacturer of wood-working machinery, has purchased Eaglefield Link Co., 1454 East Nineteenth Street, Indianapolis. It is understood that operations will be continued at Indianapolis plant for time being.

Ann Arbor Railroad Co., Ann Arbor, is planning to rebuild part of car repair works at Owosso, including coach repair shop, recently destroyed by fire, with loss of more than $100,000 including equipment.

Bellevue Industrial Furnace Co., 2971 Bellevue Avenue, Detroit, has plans for one-story addition, 80 x 165 ft., to cost about $50,000 including equipment. C. L. Phelps, Detroit Savings Bank Building, is architect.

Gifford Engine Co., Lansing, manufacturer of bushings and kindred equipment, contemplates expansion and installation of additional equipment. Company is arranging for change of name to Gifford Engineering Co.

Mueller Brass Co., 1925 Lapeer Street, Port Huron, manufacturer of brass, copper and other metal products, is considering one-story addition, to cost over $50,000 with equipment.

St. Joseph Electric Steel Castings Co., St. Joseph, is planning expansion program, including installation of facilities for production of stainless steel specialties, to cost more than $65,000 with equipment.

Detroit Edison Co., 2000 Second Avenue, Detroit, has disposed of a bond issue of $13,516,000, part of proceeds to be used for extensions and improvements in generating plants and transmission lines.

Homer Furnace Co., Coldwater, manufacturer of furnaces, iron castings, etc., is considering one-story addition to cost about $100,000 with equipment. Part of expansion will replace recent fire loss.

Board of Wayne County Commissioners, Detroit, will begin construction of new hangar at municipal airport, including installation of repair and reconditioning facilities, to cost about $325,000 with equipment.

Swope-McCracker Co., 7720 Gratiot Avenue, Detroit, and Walter Machine Co. have consolidated and are now operating as Walter Machine & Screw Co. at 500 Bellevue Street.

Hydraulic Hoist & Body Co., Detroit, has awarded general contract for an addition which will provide 44,000 sq. ft. additional floor space.

South Atlantic

BALTIMORE, Dec. 16.—F. G. Schenuit Rubber Co., 1200 Mount Royal Avenue, Baltimore, manufacturer of tires, etc., has awarded general contract to A. Kratz & Son, 118 South Carrollton Avenue, for rebuilding of two-story plant, recently destroyed by fire, to cost about $100,000 with equipment. Frank G. Schenuit is president.

In connection with an expansion program to cost $7,500,000, Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, plans extensions in gas generating and distributing lines to cost about $1,000,000. Fund of $500,000 will be used for additions and betterments in central steam-heating system in downtown district. Majority of remainder of appropriation will be used for extensions in electric light and power plants and system.

Board of Trustees, Loyola College, Evergreen Street and Charles Avenue, Baltimore, has plans for new three-story engineering building, to cost about $160,000 with equipment. L. R. White, Hearst Tower Building, is architect.

Standard Oil Co. of New Jersey, Montgomery Building, Spartanburg, S. C., is considering extensions and improvements in local oil storage and distributing plant, to cost about $75,000; a new one-story unit will be built, 60 x 100 ft., and pumping plant installed. Headquarters are at 26 Broadway, New York.

Universal Roofing Co., Rome, Ga., is planning extensions and improvements, including installation of equipment, to double present output, to cost more than $35,000.

Tyler Resilient Tire & Tube Corporation, 216 Schley Street, Cumberland, Md., is contemplating new plant at North Baltimore, where 60-acre tract has been secured, for production of recently-patented type of automobile tire, to cost over $100,000 including machinery.

City Council, Anderson, S. C., has authorized purchase of airport of Welch Aircraft Co., for municipal airport in future. Expansion is planned, including additional hangars, repair and reconditioning facilities, etc. A fund of $75,000 has been approved for project.

Potomac Electric Power Co., Fourteenth and G Streets, Washington, is arranging for expansion to total about $8,400,000, of which about $2,500,000 will be used for an addition to Bennings steam-operated electric generating plant. Work will include new power substation on Columbia Road and extensions in other such stations, to cost about $600,000 with equipment; construction of new multi-story service, operating and office building, to cost about $2,600,000, unit to include complete mechanical and electrical repair departments, meter shop, etc.; and extensions in transmission lines and distributing system to cost about $2,100,000.

Chicago

CHICAGO, Dec. 16.—New orders for machine tools are tapering sharply as the holiday season and end of the year approach. Dealers, accustomed to finding this a dull season, are hopeful that much pending business will be placed early in the new year. This is based on the fact that many quotations on machine tools are in the hands of buyers and the shaping of several large projects seems definitely assured. Deliveries are taking a sharp turn for the better. Fewer orders, combined in some cases with expansions in machine tool manufacturing facilities, are bringing this about.

Maytag Co., Newton, Iowa, has made the last purchases against a list which called for $175,000 worth of equipment. The Caterpillar Tractor Co., Peoria, Ill., is buying machine tools and foundry equipment and the Allis-Chalmers Mfg. Co., Milwaukee, is asking for prices on a few tools for expansion at its Springfield, Ill., tractor plant.

Pheoll Mfg. Co., Chicago, maker of machine screw products, will erect an addition 80 x 300 ft., three stories and basement. A. S. Alschuler, architect.

United Autographic Register Co., Chicago, will erect a new plant containing about 100,000 sq. ft. floor space, to cost $1,000,000. Frank D. Chase, Inc., is architect.

Wagner-Langemo Co., Minneapolis, manufacturer of threshers, has been purchased by Deere & Co., Moline, Ill.

T. Godwin, owner of G. & F. Mfg. Co., Exira, Iowa, maker of farm yard equipment, will erect a new one-story factory, 150 x 200 ft., at Council Bluffs, Iowa, and transfer activities there as soon as building is completed.

Liquid Carbonic Corporation, 3112 South Kedzie Avenue, Chicago, manufacturer of carbonating and bottling machinery, etc., plans expansion to cost more than $1,000,000. It is proposed to establish new plant units at Los Angeles and Seattle, and to make extensions in plants at Chicago, Long Island City, Boston, Philadelphia and Cincinnati, with installation of additional equipment. W. A. Brown is president.

Packard Motor Car Co., 1580 West Grand Boulevard, Detroit, has plans for three-story service, repair and sales building at Chicago, to cost over $125,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Board of Park Commissioners, Cutting Building, Joliet, Ill., has plans for new hangar at municipal airport, with repair and reconditioning facilities, to cost about $55,000 with equipment. Glenn G. Paul is secretary.

Northwest Paper Co., Cloquet, Minn., has plans for two-story addition, installation to include paper-making machine, heaters and auxiliary equipment, to cost over $175,000. Jacobson Engineering Co., Plymouth Building, Minneapolis, Minn., is engineer. H. S. Hornby is president.

Iowa Railway & Light Co., Cedar Rapids, Iowa, is considering hydroelectric generating plant on local site, to cost about $1,750,000 with transmission system. Company engineering department is in charge.

Chicago, Burlington & Quincy Railroad Co., 547 West Jackson Boulevard, Chicago, is planning an addition to triple capacity of stock car building plant at Omaha, Neb., to cost more than $350,000 with equipment. It is also proposed to carry out extensions in box-car manufacturing plant at Lincoln, Neb., and develop facilities for manufacture of a new type of box car, to cost more than $200,000.

United Air Cleaner Co., 9705 Cottage Grove Avenue, Chicago, manufacturer of automobile equipment, air-cooling systems, etc., is planning to rebuild part of plant recently destroyed by fire.

Naylor Pipe Co., 1230 East Ninety-second Street, Chicago, manufacturer of iron pipe, etc., has awarded general contract to A. T. Herlin & Sons, 6816 Clyde Avenue, for one-story addition, 70 x 198 ft., to cost about $35,000 with equipment. Abell-Howe Co., 53 West Jackson Boulevard, is architect.

Milwaukee

MILWAUKEE, Dec. 16.—A large amount of pending business is scheduled to be closed during January. Plant construction, in accordance with previously announced programs, will go ahead as soon as weather permits and orders for machine tools and other equipment will probably be placed early next year. The present volume of inquiries and orders is considered normal for this time of year, with current bookings mostly for single machines. Agricultural implement manufacturers report increases in dealers' contracts and have advanced production schedules ahead of dates in recent years.

Allis-Chalmers Mfg. Co. announce that no extensive purchases of machine tools for Monarch tractor division at Springfield, Ill., are planned for the present, but that it may be in the market late in spring.

Northwestern Fuel Co., Milwaukee, subsidiary of Consolidation Coal Co., New York, has purchased 10 acre tract on Twelfth Street, and will build new docks.

Globe-Union Mfg. Co., 14-18 Keefe Avenue, Milwaukee, manufacturer of storage batteries, electrical and radio supplies, has let contracts to Worden-Allen Co. for an addition, one-story, 150 x 320 ft., to cost $100,000.

Board of Vocational Education, Racine, Wis., is taking bids until Dec. 26 for three-story vocational school, 68 x 128 ft., to be first of several units, to cost $1,000,000. Frank J. Hoffman, Janes Block, is architect and T. S. Rees, director.

Nelson Machinery Co., 131 North Pearl Street, Green Bay, Wis., is building a one and two-story addition, 35 x 81 ft.

John Hoell & Co., 7225 Roosevelt Street, Green Bay, Wis., is erecting one-story machine shop, 40 x 60 ft.

City of Oconto, Wis., has acquired property for waterworks improvements to include deep-well pumps with electric drive and standpipe, to cost about $40,000. Gordon & Balot, 53 W. Jackson Boulevard, Chicago, consulting engineers, are completing plans. P. T. Meeuwsen is city clerk.

Little Wolf Power Co., New London, Wis., has plans by L. A. DeGuere, consulting engineer, Wisconsin Rapids, Wis., for a new 1350-hp. hydroelectric generating plant on Little Wolf River.

County Highway Commission, Iron Mountain, Mich., has let contracts for service shop and warehouse and is taking bids on one electric crane, but will defer purchase of tools until after Jan. 1. C. I. Israelson is County engineer.

Julius Andrae & Sons Co., electrical equipment supplies, with headquarters in Milwaukee and closely affiliated with Westinghouse Electric & Mfg. Co., Pittsburgh, has changed its name, effective Jan. 1, to Westinghouse Electric Supply Co. Herman P. Andrae will remain president-treasurer and John C. Schmidtbauer will continue as secretary and vice-president.

Cleveland

CLEVELAND, Dec. 16.—Machine tool sales were fair the past week. In fact the volume of business was surprisingly good for this season of the year. The outlook also is promising as considerable business is pending for single machines. The Electric Auto-Lite Co., Toledo, which is building an addition for the manufacture of automobile lighting and starting equipment, placed six machines with a Cleveland dealer during the week and will buy considerable more equipment. Some business is also coming from other manufacturers of automobile equipment and parts. The United Engineering & Foundry Co., Pittsburgh, which recently purchased a number of tools, will buy some additional equipment for its Youngstown plant. Sales to Cleveland companies during the week included two openside planers.

New interests have acquired control of Paper & Textile Machinery Co., Sandusky, Ohio, manufacturer of paper-making machinery, etc., and will operate in future. Expansion is planned. It is understood that W. H. Millspaugh, president, will continue to be identified with company.

Hammond Mfg. Co., 7808 Kinsman Road, Cleveland, manufacturer of polishing machinery, drilling equipment and other mechanical specialties, has plans for one-story plant, 75 x 125 ft., to cost about $60,000 with equipment. H. M. Morse Co., Finance Building, architect, will soon take bids on general contract.

Ric-Wil Co., Union Trust Building, Cleveland, manufacturer of underground conduits, etc., is contemplating one-story addition to plant at Barberton, Ohio, to cost more than $45,000 with equipment.

Republic Stamping & Enameling Co., Canton, Ohio, has plans for one-story addition, to cost more than $85,000 with equipment. This will be part of a general expansion program to be carried out in 1930.

Cincinnati

CINCINNATI, Dec. 16.—Demand for machine tools in this district slackened the past week. Orders consisted of single tools and total sales were much less than those of the preceding week. While inquiries are in fair volume, buyers are holding up decision on quotations longer than usual.

A Cincinnati manufacturer has closed for one large lathe. An unnamed railroad is reported to be in the market for several large tools.

International Clay Machinery Co., 1140 Bolander Avenue, Dayton, Ohio, manufacturer of brick-making and other clay products equipment, has awarded general contract to A. P. Ziegler, Inc., Lowe Building, for one-story addition, 42 x 78 ft., to cost about $25,000 with equipment.

Brownell Co., North Findlay Street, Dayton, Ohio, manufacturer of boilers, tanks, underfeed stokers, etc., has plans for a two-story addition, to cost more than $150,000 with equipment. Geyer & Neuffer, Ludlow Arcade, are architects.

Cincinnati Tool Co., 1951 Waverly Avenue, Norwood, manufacturer of machine tools, is considering an addition to plant, to cost about $100,000 with equipment.

Tennessee Eastern Electric Co., Johnson City, Tenn., is planning expansion to cost about $100,000, including increase in generating facilities and transmission lines.

Virginia-Tennessee Marble Co., Friendsville, Tenn., operating local quarry properties and mill of Diamond Marble Co., recently secured under lease, is planning expansion, including enlargements in mill and installation of machinery for cutting, griding, polishing, etc. Additional quarrying equipment will also be installed. Company is a subsidiary of Virginia Alberene Stone Co., which is operated by Alberene Stone Co., 153 West Twenty-third Street, New York.

American Cigar Co., 3001-15 Madison Street, Louisville, has taken out permit for an addition to cost about $250,000, including material-handling equipment and air-conditioning apparatus; also permit for improvements in present plant to cost about $50,000. Headquarters are at 111 Fifth Avenue, New York.

Louisville Water Co., Louisville, plans extensions and improvements in plants and system to cost about $175,000, including installation of pumping machinery, power and auxiliary equipment.

United States Army, Air Corps, Fairfield Air Depot, Fairfield, Ohio, will soon

CARNEGIE LIBRARY OF ATLANTA

call for bids for a one-story aircraft assembling plant on Springfield Pike, to cost about $100,000 with equipment; also for a one-story machine and repair shop, to cost about $150,000 including equipment.

Exact Weight Scale Co., Columbus, Ohio, is completing new one-story plant, 60 x 278 ft., for occupancy early next year. It will cost more than $75,000 with equipment. Carmichael & Millspaugh, Columbus, are architects.

Nashville Interurban Co., Nashville, Tenn., is considering new steam-operated electric generating plant at Franklin, Tenn., for traction line operation, to cost about $100,000 with equipment. F. H. Tathwell is chief engineer.

Gulf States

BIRMINGHAM, Dec. 16.—Southern Wheel Co., 700 Sixth Avenue, South, Birmingham, manufacturer of car wheels, has awarded general contract to M. C. Banks & Co., 2501 Avenue A, for one-story machine shop, 60 x 80 ft., to cost about $25,000 with machinery.

Southern Phosphate Co., Bartow, Fla., an interest of Davison Chemical Co., Garrett Building, Baltimore, has plans for new unit for mechanical drying, to cost over $40,000 with equipment.

City Council, Port Arthur, Tex., has plans for municipal airport on waterfront to accommodate both land and seaplanes, including hangars, repair shops and other mechanical units. A fund of $500,000 is being arranged for project.

Ford Motor Co., 3906 Harrisburg Boulevard, Houston, Tex., has awarded general contract to Tellepsen Construction Co., 3700 Clay Street, for two-story addition to local factory branch and assembling plant, 35 x 75 ft., to cost more than $45,000 with equipment. Company engineers, Detroit, are in charge.

Common Council, Tyler, Tex., has begun grading of site on Dixie Highway for new municipal airport, to include hangar, 100 x 110 ft., with lean-to extension, 15 x 100 ft., for repair and reconditioning shop, to cost more than $45,000. O. C. Palmer is manager for airport.

West Texas Utilities Co., Abilene, Tex., operating electric light and power properties, is disposing of a bond issue of $8,250,000, part of proceeds to be used for expansion in power plants and system.

Board of Trustees, Prairie View College, Prairie View, Tex., has plans for one and two-story building, to include machine shop, metal and iron-working, wood-working and other departments, to cost about $100,000 with equipment. F. E. Giesecke, College Station, is architect.

Natural Gas & Power Co., Brady, Tex., is considering construction of pipe line to Lampasas, Tex., and vicinity, with booster stations, etc., to cost more than $80,000 with equipment.

Beaird Corporation, Shreveport, La., operating a welding works, is considering expansion program, to cost more than $150,000 with equipment.

Good & Foster Aero Service Co., Dallas, Tex., is planning to rebuild hangar with shop facilities at Love Field, destroyed by fire Dec. 7.

United Gas Co., Fort Worth, Tex., operating natural gas properties, has purchased natural gas system and holdings of Magnolia Petroleum Co., Dallas, Tex., a subsidiary of Standard Oil Co. of New York, for about $50,000,000. New owner will consolidate with its properties and plans construction of pipe lines, booster stations and auxiliary structures for interchange in service.

City Council, Goose Creek, Tex., is considering construction of a municipal electric light and power plant, to cost over $50,000 with equipment.

Emery, Peck & Rockwood Development Co., Seguin, Tex., has applied for permission to take over certain properties of Syndicate Power Co., including permit for a power dam at Marble Falls on Colorado River. Company plans hydroelectric power development at that location, to cost over $250,000 with transmission system.

Gulf Paper Products, Beaumont, Tex., recently organized by O. B. Sawyer, 875 Fifth Avenue, and associates, plans erection of new factory, 60 x 125 ft., for manufacture of paper goods, tablets, etc., to cost about $50,000 with machinery. W. B. Livesay, San Jacinto Life Building, is architect.

St. Louis

ST. LOUIS, Dec. 16.—Board of Education, 911 Locust Street, St. Louis, will ask bids early in January for five-story vocational high school, to cost $950,000 with equipment. Architectural department of board is in charge.

Coca-Cola Bottling Co., 1115 Clark Avenue, St. Louis, has awarded general contract to Boaz-Kiel Construction Co., Ambassador Building, for one and two-story bottling plant, 130 x 250 ft., to include installation of conveying, elevating and other mechanical-handling equipment, to cost $125,000 with machinery. W. S. Frank, Century Building, is architect.

Chamber of Commerce, Joplin, Mo., George Schier, member of airport committee, is at head of project to establish municipal airport, to include hangars, repair shops, oil storage and distributing building, to cost about $100,000.

Wells Valve & Equipment Co., Bartlesville, Okla., care of M. G. Blair, Bartlesville, recently formed by Mr. Blair and associates with capital of $25,000, plans operation of local factory to manufacture oil-well drilling and other equipment.

Board of Trustees, University of Oklahoma, Tulsa, Okla., has awarded general contract to W. S. Bellows Construction Co., Fifth Place and College Street, for three-story and basement petroleum engineering building on campus, 88 x 126 ft., to cost about $150,000 with equipment. Henry C. Hibbs, American Trust Building, Nashville, Tenn., is architect.

United States Cold Storage Co., 500 East Third Street, Kansas City, Mo., is considering new seven-story cold storage and refrigerating plant, making second unit, to cost about $1,000,000 with machinery. Site has been selected.

City Council, Tulsa, Okla., is arranging special election Dec. 31 to vote bonds for municipal improvements, including fund of $600,000 for municipal airport, comprising hangars, repair shops and other field units.

Patterson Steel Co., North Xanthus Street, Tulsa, Okla., has filed plans for a one-story addition, 60 x 80 ft., for storage and distribution, to cost about $25,000 with equipment.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded a general contract to W. F. Kucharo, Des Moines, Iowa, for one-story factory branch, storage and distributing plant at Salina, Kan., to cost about $50,000 with equipment.

Arkansas Natural Gas Corporation, Ardis Building, Shreveport, La., is planning an expansion in Arkansas properties to cost about $6,000,000, including pipe line construction, booster stations, etc.

Yaffee Iron & Metal Co., 501 South Eleventh Street, Fort Smith, Ark., has awarded general contract to A. S. Johnson, South B Street, for two one-story additions, for storage and distribution, to cost about $30,000 with equipment. Haralson & Nelson, Merchants' National Bank Building, are architects.

J. R. Brockman Co., 617 North Second Street, St. Louis, plans investment of $175,000 for erection of one-story building, containing about 35,000 sq. ft. of floor space, for fabricating and warehousing of pipe.

Lincoln Foundry Co., St. Louis, has awarded general contracts for a new plant at Mount Carmel, Ill., consisting of foundry, 60 x 420 ft., enameling building, 60 x 100 ft., and cupola, 30 x 30 ft.

Indiana

INDIANAPOLIS, Dec. 16.—Central Mfg. Co., Connersville, manufacturer of automobile axles, etc., has awarded general contract to Austin Co., Cleveland, for one-story addition, 100 x 200 ft., to cost about $50,000 with equipment.

General Electric Co., 1635 Broadway, Fort Wayne, has taken bids on general contract for a six-story and basement addition to Fort Wayne Electric Works, 80 x 140 ft., to cost more than $250,000 with equipment. Harris & Richards, Drexel Building, Philadelphia, are architects.

Indiana Service Corporation, Fort Wayne, operating electric light and power properties, is arranging for expansion to cost $1,310,000, including extensions in power generating facilities, transmission lines and power substations.

Leader Specialty Co., 515 East Walnut Street, Indianapolis, manufacturer of plumbing equipment and supplies, has awarded general contract to Vern Headlee, 4246 Cornelius Avenue, for a one-story and basement addition, 45 x 112 ft., to cost about $40,000 with equipment. Bacon & Tislow, Architect & Builders' Building, are architects. Claude J. Mick is general manager.

Bendix Brake Corporation, Bendix Drive, South Bend, manufacturer of automobile and aircraft equipment, has awarded general contract to H. G. Christman & Co., 306 Notre Dame Avenue, for one-story addition, to cost about $45,000 with equipment. Company plans erection of additional units at early date.

Pacific Coast

SAN FRANCISCO, Dec. 12 — Southern Pacific Railway, 65 Market Street, San Francisco, is considering extensions and improvements in shops at Sparks, Nev., to cost more than $70,000 with equipment.

Procter & Gamble Co., Gwynne Building, Cincinnati, has taken title to property, 521 x 1255 ft., at Long Beach, Cal., and has plans for initial units of new plant, consisting of two main buildings, 100 x 700 ft., and 100 x 500 ft., for which bids will be asked soon. A battery of 12 steel storage tanks will be installed; a 500-ft. wharf also will be built. Project will cost about $5,000,000 with machinery.

Byron-Jackson Pump Co., Berkeley, Cal., manufacturer of pumping machinery,

oil-well supplies, etc., will soon begin work on one-story addition, to cost about $30,000 with equipment. General contract has been let to Austin Co. of California, Inc., Oakland.

Department of Public Utilities, Tacoma, Wash., Ira Davisson, commissioner, is considering construction of steam-operated electric generating plant for emergency service in connection with municipal hydroelectric generating stations, to cost over $150,000 with machinery.

Puget Sound Navy Yard, United States Navy, Bremerton, Wash., has secured an appropriation of $31,000 for addition to machine shop. Capt. E. R. Gayler is in charge.

Compton Union High School District, Compton, Cal., will build one-story vocational training shop at new junior high school group in Enterprise district to cost over $200,000, for which bids will be received on general contract on Jan. 3. John C. Austin and Frederic M. Ashley, Chamber of Commerce Building, Los Angeles, are architects.

Vallejo Electric Light & Power Co., Vallejo, Cal., is planning extensions and improvements to cost about $50,000.

Canada

TORONTO, Dec. 16.—While demand for machine tools has tapered from that of a couple of months ago, sales are up to average for this season of the year. Inquiries coming out give good indications of more extensive buying in the early part of the new year. Replacement buying is a feature of present business with some small lists for plant additions. The recent heavy placing of rolling stock orders by Canadian railroads is beginning to have a stimulating effect. The automotive industry is buying in a small way.

A Toronto syndicate has purchased Georgetown Foundry & Machine Co., which will hereafter be known as Credit Valley Foundry Co., Georgetown, Ont. Production is expected to start in near future. A new electric smelting furnace will be installed.

Aluminum Co. of Canada, Ltd., 158 Sterling Road, Toronto, has awarded several contracts for erection of an addition, to cost $50,000.

Canadian Paperboard Co., 32 Front Street, Toronto, has awarded contracts for erection of an addition, to cost $60,000.

A. Wander, Ltd., 455 King Street West, Toronto, has let general contract to T. A. Brown Co., Ltd., Wolfe Street, Peterborough, Ont., for a plant at Peterborough, to cost $50,000. Chapman & Oxley, 372 Bay Street, Toronto, are architects.

Weaver Canadian Co., Ltd., manufacturer of automobile jacks, pumps, etc., Chatham, Ont., will start work in spring on a plant addition.

Bids are being received, no closing date, by C. H. R. Fuller, business administrator, Centre Street School, Oshawa, Ont., for machine shop equipment, for Board of Education.

United Mfg. Co., Cap de la Madeleine, Que., has awarded contracts for erection of a plant, to cost $85,000. Charles Page Construction Co., Three Rivers, Que., has general contract. Philip Fainer, 1470 Peel Street, Montreal, is president of company.

Stewart-Warner Speedometer Corporation, Chicago, is considering consolidation of its Canadian units at Belleville, Ont. Plans are under way for erection of two two-story buildings, 50 x 180 ft., and 40 x 50 ft.

Western Canada

Pilkington Brothers (Canada), Ltd., 163 Market Street East, Winnipeg, contemplate erection of a glass manufacturing plant at Regina, Sask., to cost $80,000.

Soo Line Mills, Ltd., Weyburn, Sask., will start work soon on erection of flour mill, to cost $100,000.

Canadian National Railways, A. A. Tisdale, Winnipeg, general manager of Western region, contemplates building a rail salvaging plant at St. Boniface, Man.

Kapoor Lumber Co., Cowichan Lake, B. C., has plans for a two-story sawmill to cost $50,000.

In connection with hydroelectric power development plant at Lois River, B. C., for Powell River Power Co., Powell River, B. C., contract for first unit has been awarded to Stuart Cameron Co., Ltd., 543 Granville Street, Vancouver, B. C., at a cost of about $2,000,000. R. Bell-Irving is engineer.

Foreign

PLANS are under way by Ygnacio Soto, Nogales, Ariz., and associates, for construction of new cement mill at Hermosillo, Sonora, Mexico. Project will include power house and will cost close to $500,000 with machinery. It is expected to organize a company to carry out development, which has backing of Francisco Elias, governor of Sonora, Hermosillo.

Gillette Safety Razor Co., 15 West First Street, Boston, has secured concession from Soviet Russian Government for construction of plant in that country to manufacture razor handles and blades, to cost more than $1,000,000.

Officials of British Shareholders Trust, Ltd., London, England, headed by Sir John Ferguson, have formed British Can Co., Ltd., with initial capital of £536,000 (about $2,680,000), to manufacture tin cans and containers. Company has purchased plant and business of Ernest Taylor, Ltd., Liverpool, manufacturer of cans and metal containers, and will operate as first plant. Plans are under way for erection of other works. In addition to capital issue noted, company will dispose of 186,000 shares of preferred stock, to total about $930,000. New organization will be associated with American Can Co., 230 Park Avenue, and Thermokept Corporation, 522 Fifth Avenue, New York, both holding a financial interest in company. Edgar W. Carmmond, president of British Shareholders Trust, Ltd., will be identified in an official capacity with new organization.

A company at Liverpool, England, has acquired a 40 acre tract on Manchester ship canal, as site for a newsprint paper mill. It will have a capacity of 60,000 tons per annum and is scheduled for completion in about 12 months. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference United Kingdom No. 320708.

Stiassny Glass Works, Vienna, Austria, will build a new plate glass manufacturing plant at Burmoos, near Salzburg, to cost more than $800,000 with machinery. Site has been acquired and work will proceed at once.

Latvian Marine Department, Riga, is planning construction of a three-story warehouse in harbor district for which three lifting cranes and other mechanical-handling equipment will be purchased. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Riga No. 97435.

New Trade Publications

Cross-Drum Boiler.—Erie City Iron Works, Erie, Pa. Four-page folder illustrating and describing a cross-drum boiler which is made in three diameters, 42, 48 and 54 in. It may be fired by mechanical stokers, or with pulverized coal or fuel oil.

Deaerator and Hot-Water Generator.—Cochrane Corporation, Philadelphia. Bulletin 686 of 20 pages, illustrating and describing self-contained deaerator and hot-water generator; also describing the heating, deaerating, softening, filtering and metering of water, measuring of steam and profitable utilization of low-pressure steam, etc.

Electric Hoists.—Robbins & Myers, Inc., Springfield, Ohio. Bulletin 5031, of 16 pages, illustrating and describing various types and sizes of electric trolley-type hoists. Clearance diagrams and other dimensions are given. Ratings are 250 to 15,000 lb.

Electric Gasoline Gage.—General Electric Co., Schenectady, N. Y. Bulletin GEA-1182 of 4 pages illustrating and describing electric gasoline gage for aircraft, designed to meet requirements for reliability, accuracy under all conditions of flight, light weight and simplicity of installation.

Switchboards.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Folder with illustrations describing truck-type switchboards in various applications.

Continental Shares, Inc., Reveals Steel Stocks

Holdings of stock in steel companies by Continental Shares, Inc., Cleveland, an investment trust controlled by the Otis-Eaton-Mather group, are revealed in the listing of that company's stock on the New York Stock Exchange. The largest single holding is 245,142 shares in the Cleveland Cliffs Corporation, formed last June as a holding company that effected a merger of the Cleveland Cliffs Iron Co. and Cyrus S. Eaton interests.

Other steel plant stock held by Continental Shares Oct. 31, as listed, were: Central Alloy Steel Corporation, 46,700 shares, Inland Steel Co., 1000 shares, Youngstown Sheet & Tube Co., 8000 shares, Donner Steel Co., Inc,. 250,000 shares, Donner Steel Co. preferred 15,000 shares, and Wheeling Steel Corporation, 3243 shares. Ownership in various other industrial stocks was listed as well as public utility and bank stocks.

The Cliffs Corporation, it was disclosed, holds 99,860 shares in the Republic Iron & Steel Co., 99,860 shares in the Inland Steel Co., 125,821 shares in the Youngstown Sheet & Tube Co., 109,837 shares in the Central Alloy Steel Corporation, 29,957 shares in the Wheeling Steel Corporation and 397,736 shares in the Cleveland-Cliffs Iron Co.

The holding company stated that the total value, as of Nov. 30, of all of its securities was $130,000,303 against an original cost of $122,355,813, or an appreciation of $7,644,490 despite the recent decline in stock values.

C. S. Eaton is chairman of Continental Shares, Inc., and W. R. Burwell is president.

Many Accidents Caused by Moving Material by Hand

Of the accidents occurring in industrial plants from non-mechanical causes 33⅓ per cent were the result of manual handling of material, according to a survey recently made by Edward O. Allard, manager of the safety engineering and inspection department of the American Surety Co. and its affiliated company, the New York Casualty Co. In machine shops the survey revealed that 46 per cent of the accidents were due to moving materials by hand.

Road Machinery Sales Large

Orders for road building machinery have been booked in such volume by Foote Brothers Gear & Machine Co. as to keep the plant operating at full capacity for more than four months, according to a statement by W. C. Davis, president of the company. The regular quarterly dividends of $1.75 a share on the preferred and 30c. a share on the common stock have been declared, payable Jan. 2.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

BUSINESS men are generally optimistic, although manufacturing, general industry and jobbing trades are markedly lower than a year ago. Retail trade is slightly lower, although sales of low-priced novelties are very good . . . Fur merchants report 1929 sales 13 per cent under the 5-yr. average.

* * * * *

COMMODITY index is down 0.1 per cent; the sharpest decline noted is in wheat (7c. per bu.) due to slow export demand . . . Secretary of Agriculture Hyde estimates the 1929 farm income ($12,500,000,000) to be higher than any year since 1920, except one . . . Arthur Reynolds, leading Chicago banker, advises rural correspondents that present situation warrants no other than usual precautions in supplying funds to local manufacturers and merchants.

* * * * *

UNION miners in western Kentucky coal fields strike for revised wage scale . . . Garment workers' unions have authorized several strikes, to commence early in 1930, where contracts expire or where working conditions are held to be subnormal . . . Establishment of impartial umpire and special mediation court has adjusted amicably 95 out of every 100 disputes occurring in New York garment trades during the past five years.

* * * * *

COTTON textile manufacturing is distributed unevenly; sales for the whole industry amount to about two-thirds of current production; unfilled orders equal four-fifths of finished stocks . . . Goodyear Tire & Rubber Co. starts a 50,000-spindle plant in Georgia for tire fabric . . . Woolen trade in New England is very quiet.

* * * * *

COPPER production in the Northwest has been curtailed . . . Good prices for the metal and improved technology have expanded the copper output of northern Michigan about 10 per cent over 1928 . . . A $4,000,000 copper refinery has been completed at El Paso, Texas . . . Joplin, Mo., zinc district, with capacity of 14,000 tons per week, is operating on a 6000-ton basis . . . Low prices for tin have slowed up all trade in Bolivia and have caused the Federated Malay States to prohibit expansion of placer mining areas.

* * * * *

DIVIDENDS on common and preferred stock were increased from $4 to $5 by Westinghouse Electric & Mfg. Co. . . . A civic organization in New York charges that each customer pays $8.28 annually on "water" in local electric utility stock . . . Federal Power Commission notes that steam-generated power is increasing at a far more rapid rate than hydro-electric, "due to unnecessary handicaps of legislation and regulation" . . . Governor Roosevelt of New York said that the Government should own and operate power plants at Muscle Shoals, Boulder Dam and on the St. Lawrence, "to remain forever as a yardstick to measure the cost of electricity."

EMPLOYMENT in the United States is seasonably low, but not much lower than in 1927 or 1928 except in one or two centers—notably St. Louis . . . Unemployment in Germany and Austria is especially acute; 1,400,000 are receiving doles and the German treasury is nearly empty . . . Belgian and Dutch diamond cutters (about 40,000 in number) are working half time, and the Diamond Syndicate has withdrawn all offerings of uncut stones to the trade . . . France, however, has only 577 registered unemployed. Its population of 40,750,000 is 2,220,000 less than 1911, despite the importation of about 3,000,000 alien laborers.

* * * * *

CIGARETTES have been cut in retail price by chain stores to a figure less than wholesale cost to the small dealer . . . Schulte-United 5c. to $1 Stores, passes $1.75 quarterly dividend.

* * * * *

RAILWAY net earnings in October were 5.6 per cent less than in 1928, largely due to decreased movement of grain in West . . . Interstate Commerce Commission authorizes 160 miles of railroad construction near the Texas-New Mexico border, and orders the Union Pacific to construct a 185-mile connection to the Southern Pacific through the Cascade Mountains in Oregon . . . A 5-year, $140,000,000 job of removing 4½ miles of track from streets in Manhattan to a private right-of-way (elevated and subway) is commenced by the New York Central Railroad.

* * * * *

STORM and floods strand 70 large vessels on northern European shores and destroy much property . . . Royal Mail Steam Packet Co., which controls one-sixth of the British merchant marine, passes a dividend . . . Four new 7000-ton 14-knot ships, in addition to two now building, will be required for new mail routes to the Black Sea, assigned to American Export Line.

* * * * *

RADIO service is commenced, Sayville, N. Y., to Lima, Peru . . . O. D. Young and J. G. Harbord of General Electric Co. and Radio Corporation of America, tell Senate committee that unification of cable, wire and wireless foreign communication, under either Government regulation or ownership, is necessary to meet competition with systems subsidized or owned by foreign governments . . . Only 168 of the 317 broadcasting stations returned profits in 1929.

New York, December 26, 1929

ESTABLISHED 1855

VOL. 124, No. 27

Radio Sets Put on Production Basis

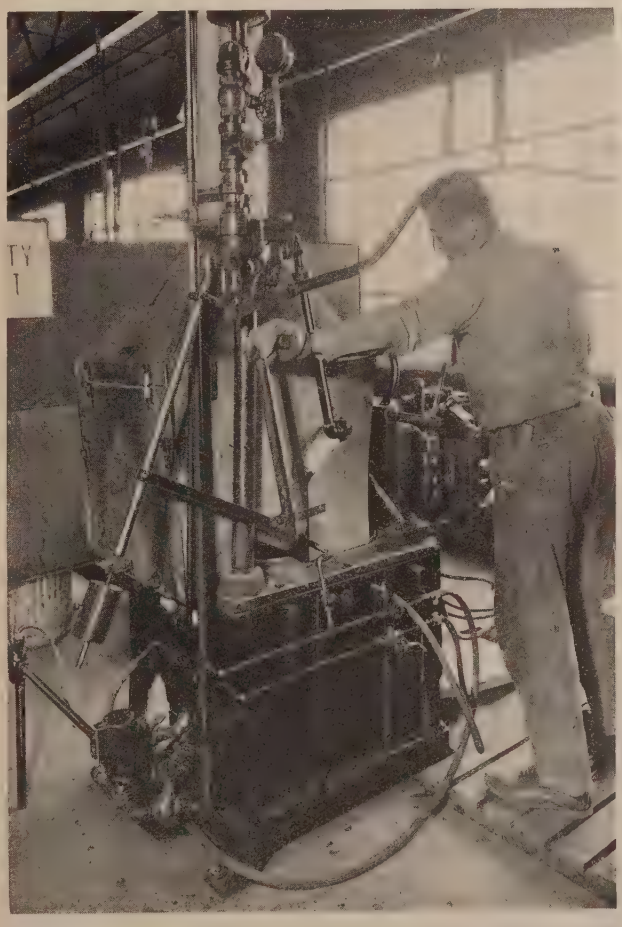
Method of Assembling and Testing Radio Units at the Crosley Plant Has Resulted in Manufacturing Economies

BY J. B. NEALEY*

THE design and manufacture of radio receiving sets have been forced to go through the various stages of development that are encountered in perfecting any mechanism. With the modern production methods of the automotive and other industries as a guide, however, the manufacture of this comparatively new product has been brought to a high degree of efficiency in an unusually short space of time, despite the intricacy and "trickiness" of a complex mechanism reproducing ephemeral tone qualities.

The Crosley Radio Corporation, Cincinnati, is putting out a line of radio receiving sets for which there has been such a great demand that the company operates in mass production. One of the biggest factors contributing to its success is its method of assembling and testing radio units, the entire process of manufacture being as near straight-line mechanical progression as possible.

The concern has three plants in Cincinnati. Assembly, testing and some manufacture are carried on in plant No. 1, which is six stories high. Production schedules, ranging from 1000 to 5000 sets, are made out a week in advance. Requisitions for parts and for sub-assemblies, in sufficient volume to fit the schedule, are then made to the foremen of the various departments and distribution is timed to meet their various requirements.



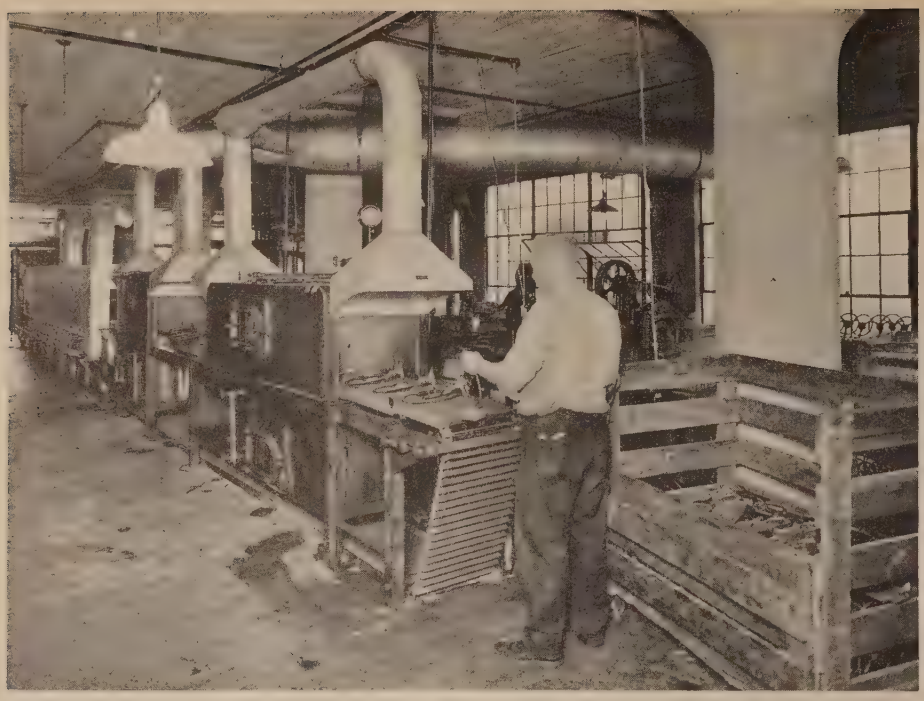
POT of Die Casting Machine Is Heated by Single Gas Burner Which Will Melt Cold Charge in 30 Min. Automatic temperature control is provided

Condensers are manufactured and assembled on the top floor, starting with the die casting of the stator and rotor blades into groups, after which the fins are trimmed from the die cast pillars and holes are tapped. A long line of presses and tapping machines are provided for this purpose.

Blade assembly sets are washed in a continuous, automatic gas-fired washing machine built of sheet metal. Work is sent through in pans with screen bottoms on a slat-type conveyor. Steam and water coils and jets for spraying are located in the first part of the machine, while the second part is for drying and is equipped with nine gas burners, equally spaced. There is a loading and unloading platform at opposite ends of the machine, the capacity of which is close to 10,000 sets of blade assemblies daily. It is 12 ft. long, 3 ft. wide and 4½ ft. high. The final operation is pressing in the rotor shafts.

The die casting department contains 10 die

*American Gas Association.



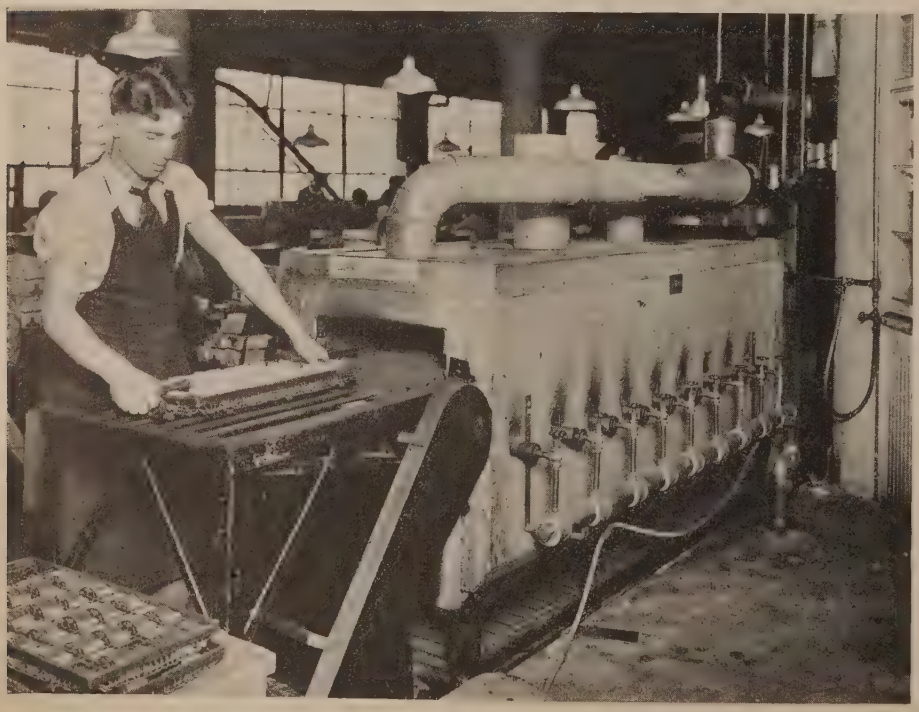
PARTS Are Cleaned and Dried in Automatic Cleaning Machine Equipped with Continuous Conveyor. Hot solution tank, hot water rinse tank and drying portion of machine are heated by gas. Machine can handle 30,000 parts daily

casting machines, and the metal, which is a zinc-copper-aluminum alloy, is melted with gas. The pots are 18 x 24 in. and are 15 in. deep, being heated by a single gas burner which will melt a cold charge in 30 min. An obsolete burner, formerly employed, required 2¾ hr. to do the same work. Pots are equipped with automatic temperature controls so that attention on the part of the operator is not required for this purpose.

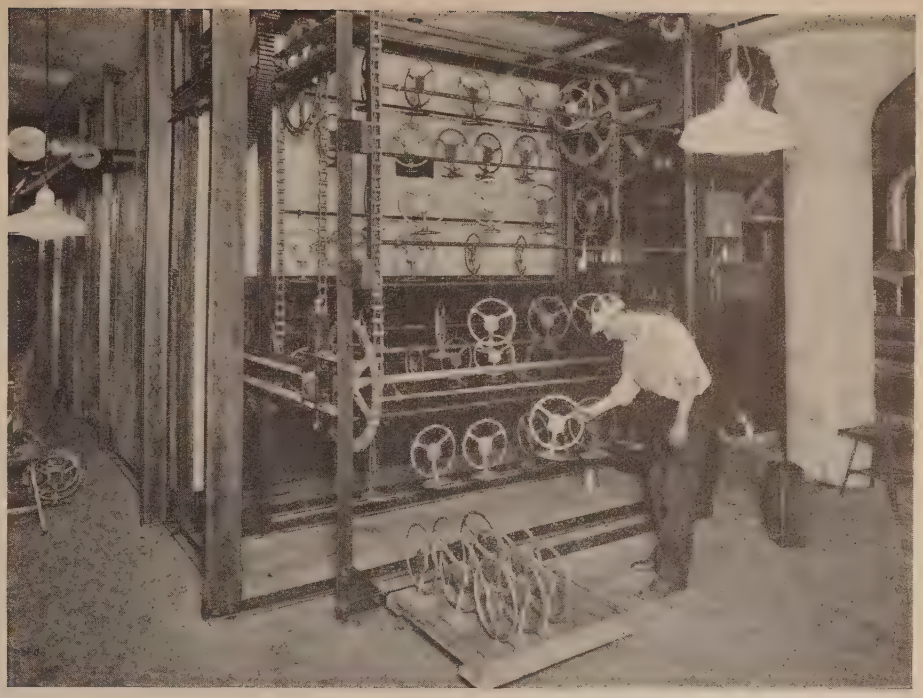
A goose neck sets down in the molten metal and the dies are held together in a machine just above and in front of the pot. The blades are set in a jig and placed in dies, which are closed under pressure. The goose neck is filled with metal, one end is elevated until the nozzle fits into an opening at the base of the dies and compressed air is used to force the metal into the dies, the molten metal chilling and setting the instant it comes into contact with the cold metal of the die.

Condensers are assembled on two tables about 200 ft. long and 3 ft. wide. Down the center of the tables runs a traveling belt conveyor. Parts are distributed to various stations along the tables, having been sent up from storage below by elevator. The condenser frame, a steel stamping with two partitions, is started down the line, the stators and rotors being put in and other parts affixed as it travels along.

As the three tuning or radio frequency coils and the



BLADE Assembly Sets Are Washed in Continuous Automatic Washing Machine. Work is sent through in pans with screen bottoms on a slat-type conveyor



AFTER Being Japanned, Parts Pass Through Gas-Fired Automatic Oven with Continuous Conveyor Consisting of Two Long Endless Chains Connected by Rods. Conveyor makes five vertical passes during journey through oven

three variable condensers must have identical electro characteristics (resistance, capacity and uniformity throughout a broadcast range), the condenser is tested and proper adjustments are made on the assembly line. These characteristics are then checked by another tester equipped with the proper appliances. The cover is put on and the finished condenser is hooked on to an overhead chain conveyor, which takes it to the receiving unit assembly department on the floor below.

Here units are assembled on 14 long tables, each about 75 ft. in length, running transversely across the room. The operations are as follows:

1. Tube sockets riveted into bottom panel.
2. Fixed condenser put on.
3. Transformer and wires put on.
4. Antennæ choke and connector strip.
5. Balance condensers.
6. Wires fastened to terminals.
7. Radio frequency coils and metal shields.
8. Tested for loose connections and matching of radio frequency coils.
9. Parts wired together.
10. Variable condenser attached. Here, the overhead conveyor from the floor above, carrying the condensers, crosses the table and the operator at this station on the line reaches up and takes them off as they come.
11. Other small parts put on.

A complicated testing mechanism, developed by the company, is located at the end of the line, where the set is

ASSEMBLY Work Is Done by Operators at Long Bench. Overhead chain conveyor is used to carry parts from one operation to next

tested for loose connections. The set is placed in a frame with 32 electrical points which match and contact perfectly the 32 points of the set. These are wired to a 32-point switch. There are seven jacks with four points each and seven more that fit in the tube holders. A panel contains numerous small lights, a millimeter, voltmeter and galvanometer. An accurate check is made of all connections in the set by rotating the switch and operating the jacks.

The finished receiving unit is then put on a conveyor, which takes it to the floor below, where the converters for the a.c. current are assembled. Here are located the same number of cross tables or assembly lines as on the floor above. The assembly starts with the frame, which is a steel stamping, and to it are added the transformer, chokes, condensers, resistance and other small parts as it moves down the line.

ONE of Assembly Lines with 40 Operators. Inspectors and testers are in foreground

Converters Added to Receiving Unit

The overhead conveyor, with completed receiving units from the floor above, crosses the assembly lines at the proper point and the operators remove them and attach the converter. This forms the radio set of commerce. Here the entire set is tested for continuity, that is, to show that all circuits are complete and that the proper voltages are supplied to the various tube filaments and plates. The set is lifted up to the chain conveyor from the ends of the assembly tables and carried to the floor below, where the principal testing is done.

As quiet and complete freedom from electrical disturbances are necessary, testers are placed in sheet steel booths, of which there are a large number, arranged in rows. A traveling belt conveyor runs the length of each row, small windows being provided in each booth for it to pass through. There are four testers in each booth, who remove sets as they pass through and replace them on the belt when they have been tested.

Much money and time have been spent in the Crosley laboratories in designing a testing unit by the aid of which radio design could be put on an exact basis. With the apparatus already developed, it is possible to measure with extreme closeness the sensitivity, selectivity, tone quality and amplification of any radio set in a few minutes. These tests are always made under the same conditions and may be repeated any number of times with the same results.

A signal is made especially for the test and its frequency may be adjusted to any value within the broadcasting range. The strength of the signal can be easily controlled within wide limits. Outside conditions, such as weather, static, etc., are excluded and are factors that do not affect this test. The overall performance of the set can be checked, or, if desired, any part such as the radio-frequency or audio-frequency may be tested separately. In this way it is possible to study a new set throughout all of its stages of development, detect any inferior part and redesign it. Furthermore, competing sets on the market can be measured with a common yardstick and their performances compared.

Cabinets, made of steel stampings, are received, washed, dried, japanned and baked on the second floor. The cleaning machine is automatic and has a continuous conveyor. It is of steel construction and is 52 ft. long, 4 ft. wide and 5 ft. high. The conveyor consists of two long chains of 6-in. links, with small wheels at short intervals riding on tracks at each side of the machine. A wide wire screen is suspended between the chains and cabinets are carried through on the conveyor, which is driven by a motor through variable-speed gears.

The first half of the machine is equipped with tanks and pumps below the conveyor and with coils and sprays above. In the first tank is a hot cleaning solution, which is pumped up into the coils and forced down on to the cabinets in jets. From this point it falls back into the tank for reuse. The next operation is similar, only a hot water rinse is used, followed by a cold water rinse, after which steam is forced on to the cabinets. Cold compressed air is then used to blow off some of the moisture as the work proceeds into the second half of the machine, which consists of the dryer.

The drying portion is equipped with four gas burners, two located in the front end and two in the discharge end. An automatic control, attached to each group, maintains constantly the correct heat in the dryer. The hot solution tank and the hot water rinse tank are heated with gas burners which are also automatically controlled to maintain the liquids at the correct temperature. This machine will wash and dry 30,000 or more parts daily, seven minutes being required for each part to travel through the machine.

Cabinet sections are then sprayed with japan in a long line of spray booths and sent through a gas-fired, automatic bake oven. This oven is 30 ft. long, 10 ft. wide and 9 ft. high and is provided with a continuous conveyor. The oven proper is constructed of sheet steel. The conveyor, consisting of two long endless chains connected by transverse rods, makes five vertical passes in the oven during the course of its travel.

Heat is supplied through eight long gas-pipe burners equipped with two automatic temperature controls with recording pyrometers. These maintain a temperature of 160 deg. Fahr. in the first part of the oven and 350 deg. in the second. The baking period, which is controlled by the speed of the motor-driven conveyor, is 45 min. A cabinet consists of three pieces and 9000 pieces can be japanned and baked in this oven daily. Other finishes require different temperatures and baking periods.

Following the spraying and drying operations, sets are placed in cabinets and the complete units are sent to the shipping department.

Promise of Steel Plate Floor for All Sorts of Buildings

THE new floor construction, known as the battledeck type, was announced and given its first public demonstration at the seventh annual convention of the American Institute of Steel Construction, Inc., at Biloxi, Miss., Nov. 14, as mentioned in THE IRON AGE of Nov. 21, page 1379. A special General Electric automatic arc welding machine there illustrated stitched the plates and beams together to form the flooring.

The new floor is described by the institute of steel construction as being a solid steel deck which acts as a girder to prevent any torsional distortion of the building when subjected to wind or earthquake action. It enables the engineer to select that part of the structure which is to carry the wind stresses to the foundations, and to be assured that the deck flooring will deliver the stresses to the most rigid part of the vertical frame. The floor construction can be carried out into the walls to provide standard construction to support the outside walls. It will provide a working floor for other trades and in many places eliminate the necessity of temporary planked floors.

The total cost of a floor constructed of 3-in. I-beams and 3/16-in. plates, covered on the top with cork tile and fireproofed on the under side, is estimated by the institute as being a little over $1 per sq. ft. It is pointed out, however, in this connection, that the cork tile floor eliminates the necessity of any other floor covering, which is always a part of a tenant's expense when using an ordinary masonry floor. The cost of a good chenille carpet alone is from $1.25 to $1.50 per sq. ft., and the welded battledeck floor complete will cost less than the carpet and eliminates its necessity.

The welding machine consists of a three-wheeled self-propelled vehicle driven by an adjustable-speed motor. On the framework are mounted a wire feeding device, a reel of welding wire, the travel motor and the control devices, all occupying a space of less than 5 sq. ft. and having a height of 2 ft. A motor generator at a remote point supplies, through a trailing cable, the current for welding and for operating the travel motor. The speed of travel and the speed of the welding wire feed can be varied by adjusting small rheostats. In the demonstration at Biloxi a satisfactory weld was accomplished at a speed of 9½ in. per min.

In operation the machine is placed on the beginning of a seam where it is lined up and started running. If by any chance it should tend to deviate from the seam during the course of travel, it can be easily steered by means of a small steering wheel on the mechanism. At the end of the seam it is merely necessary to turn the machine around and place it on the beginning of the next seam, proceeding from this point as before until all seams are welded.

The new steel floor, says the institute, is equally applicable to residences, multiple-story buildings and bridges, and for building construction it will save from 20 to 60 lb. per sq. ft. of floor in dead weight. In connection with a 75-story building with floor panels 21½ x 22½ ft., the saving in dead load on the foundations for each column is nearly two million pounds, and indicates that its use will permit an increase of 25 per cent or more in the height of the building or in the number of floors without increasing the loads on the foundations.

Handling Equipment Increases Unit Loads and Lowers Rehandling

Every successful installation of material-handling machinery is successful because it does one of two things. It either eliminates rehandling operations or it permits the handling of more material each trip. Discussing these factors before an engineering meeting in Akron, E. T. Bennington, Cleveland Electric Tramrail, Wickliffe, Ohio, said that many have a great deal of faith in what can be accomplished through the use of these two fundamental principles as applied to overhead conveying. But the large majority of engineers have not yet come to realize the real advantages through proper use of these principles of overhead conveying machinery.

The savings and advantages do not lie alone in reducing the cost of the payroll for the men actually engaged in moving materials. The application of these principles has usually a far-reaching effect. It has been known to affect the operating costs in every department in some of the largest plants in the country.

Capacity Quadrupled

As an example of elementary rehandling operations may be considered the handling of coils of wire in a large steel mill. A hairpin hook on a tramrail system lifts 3300 lb. of rod, made up of 11 bundles weighing 300 lb. each. Before the installation of the tramrail system 20 men were employed in handling this wire rod as it came off the mill. It was rehandled many times before it entered the manufacturing department or was placed on cars.

A conception of the relative capacity of hand labor aided by trucks, and the hairpin hook unit on the tramrail system, can be obtained by considering that the capacity of 20 men and a few trucks was 200 tons loaded into cars per day. Now, one unit is capable of loading 900 tons per day, if the wire mill could produce this amount of material.

Cast Aluminum Alloy That Compares With Die Castings

Made in Sand and Requires Minimum Machining—Unusual Practice at United States Naval Gun Factory

BY LEWIS H. FAWCETT*

EVERYONE conversant with the foundry industry is familiar with the accurate molding required in the manufacture of special iron castings, such as those that have been used in typewriter and cash register assemblies, where a minimum machine finish was required. Stove plate molding, also, has always demanded a high grade of work to produce the neat fits without machining so characteristic of those well-built articles. Likewise, a vast quantity of exact castings have been made of tin bronze in various compositions.

But, today, when light metal castings of precise dimensions are contemplated, one naturally thinks of die castings, their composition and the accurate equipment necessary to their production. In like manner, when manufacturing aluminum alloy sand castings with tolerances approaching die castings, the essential demands are composition and adequate equipment. The composition involved in this particular case can be disposed of in a few words as it consists of an alloy containing 95 per cent aluminum and 5 per cent silicon, designated as Navy Department Specifications 46 A 1 a, Class 2. This combination casts readily and produces sound castings free from checks and other molding troubles.

Metal and Wooden Patterns Used

Patterns must be so constructed that their original dimensions may be preserved. This is accomplished by the use of metal patterns where large quantities of castings are required; but the majority of patterns are made of hard wood, and in this case saw cuts are at times made in thin sections to allow expansion and contraction of members of pattern assembly without affecting the controlling dimensions. Different shrinkage (contraction) rules are used on the same pattern to cover varying conditions; and yet the pattern as a whole is designed to prevent restriction of contraction as far as possible. In this connection it is also essential to have accurate checking and severe inspection of the initial casting before proceeding with production.

Foundry equipment has been designed with a view toward obtaining maximum accuracy. Core benches are rigidly constructed of wood and rest on a level floor paved with wooden blocks. The bench top consists of a cast iron plate which has been machined to obtain a plane surface. All core plates are of iron, machined on face and supporting ribs. Rectangular blocks of cast iron machined all over are used as guides in removing core boxes from the cores, and where possible the boxes are constructed to part, so as to obviate the "rolling over" of the core.

Machine finish on equipment of this kind may seem extravagant but these shop tools have been in use for more than ten years and have fully justified their original cost. Pressed steel flasks for small jobs and substantial wooden flasks for large work are used in molding to prevent springing, and great care is taken to secure accuracy in flask pin alinement. Straight line railroad tracks leading into the core ovens pass between the core benches and the molding floor. Low flat cars, the width of the core ovens, run on these tracks. The floor or top of the car consists of a machine finished cast iron plate.

The more machining performed on the equipment the less machining required on the product. These true flat top cars permit full loading and movement into the ovens without vibration to cores. At night the cars are shoved into oil-fired insulated ovens and heated gradually to from 450 to 500 deg. Fahr. in about two hours time, this temperature being maintained for an additional two hours. The heat is then cut off. As the ovens are well insulated to prevent loss of heat, their temperature will have fallen only to from 350 to 400 deg. Fahr. on the following morning when

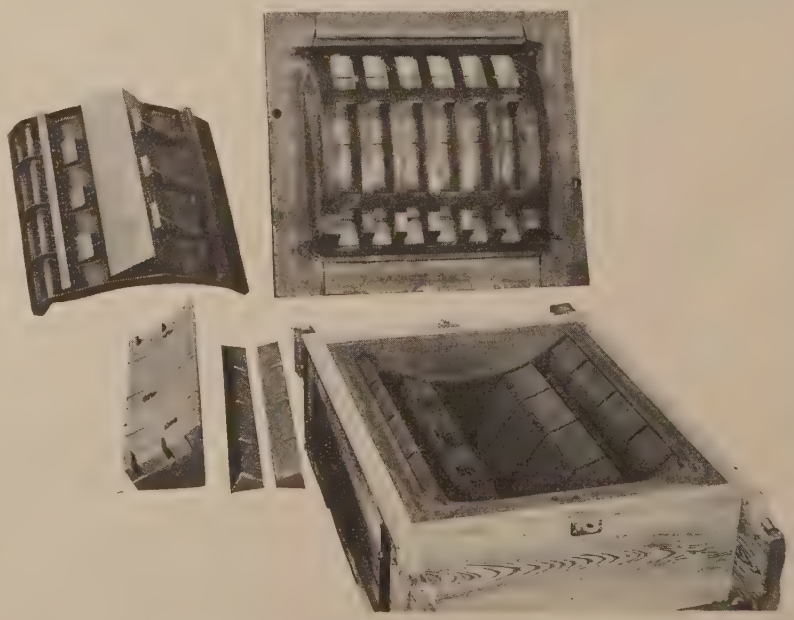


FIG. 1—Pattern and Drag of Chute Casting. To the right is the drag before the cores are set. Cores are shown to the left. In the background is the pattern on the left with the follow board at the right

*Metallurgical and Testing Division, United States Naval Gun Factory, Washington.

FIG. 2—The Core Bench and the Two Auxiliary Tables Have Machine Cast Iron Tops. On one is the core plate with two cores thereon and in the center a core box is being used to make a core. The foundry floor is composed of wooden blocks

the cars are removed. Having mentioned some of the precautions taken in the interest of accuracy, regarding the equipment, some idea of the molding practice will now be attempted by an outline of this procedure as applied to one comparatively simple job.

Molding of a Chute Casting, Typical Case

The casting to be described is the top member of a rectangular fabricated chute. This assembly is composed mainly of rolled sheet duralumin, 3/16 in. thick, its ends and top are designed as silicon-aluminum alloy castings which are bolted to these sheets.

Pattern, and the drag section of flask, are placed upon the follow board, the follow board being so designed as to fully support pattern during ramming. Facing sand is riddled on the pattern and carefully tucked around it; the drag is then shoveled full of heap sand and rammed up. The surplus sand is leveled off with a strike and the bottom board rubbed to a firm fit. Drag is then rolled over and the follow board removed. Parting compound is sprinkled over impressions made by follow board. The cope, which is barred to the approximate shape of the follow board, is set in place on the drag, filled with sand and rammed up.

Two wedge-shaped gates, three round risers, and an appropriate number of gaggers to support the sand when cope is lifted are utilized in molding the cope. Large vents, to permit easy escape of air, are made on each corner of the mold, at the highest points, and the usual amount of vents is also made over the entire surface of cope. Cope is then taken off; the pattern is removed from the drag and cope and drag-finished in a workmanlike manner.

The molding is done in green sand using No. 0 Albany sand which is mixed, ⅛ new sand and ⅞ used sand, for the facing material. Facing sand is riddled through a No. 6 sieve and the heap sand through a No. 4 sieve. Proper tempering of sand is important, best results being obtained when the sand is worked as dry as practicable, moisture content not exceeding 6 per cent. A high-grade dry Ceylon graphite is applied to the cope, no blacking is used on the sand in the drag. Chills are used and their use is recommended where practical in lieu of risers, in order not to cause excessive restriction of contraction. The flask used on this job is made of wood 2¾ in. thick 38 x 42½ in. inside, cope 9 in. deep and drag 14 in.

Foreground of Fig. 1 shows the drag, to the right, before the cores are set in place. The cores are shown on the left. In the background the pattern is on the left and the follow board on the right of picture. Ten copper chills are used in the drag, one under each of the six lugs, and four on the edge to the right of central portion of drag. These chills are painted with wet blacking. Note the nails used to chill the metal along the grooves in the sand which form ribs in the casting.

Two steel strips placed diagonally in the sand on the bottom of right bank of the central impression for the large core are not chills but bearings for the large central core. One of these bearings is barely visible, the other is on the same side or bank but does not show in the picture. A hole about 1½ in. in diameter is made through the sand in the bottom central portion of the drag to vent the large core. This venting is accomplished by a similar hole in the bottom of the core, leading to the interior of core which is filled with broken coke; and a 1-in. diameter hole in the bottom board. Attention is also directed to the three lifting hooks in the large central core. The other two cores have similar hooks.

The three cores used in molding this casting are

FIG. 3—In the Foreground Is a Mold Ready to Close. The pattern is in place on the follow board in the background. The cope at the right shows the position of the three risers.

made in wooden core boxes which are designed to part in order to obviate the necessity of rolling over, as the cores are purposely of very fragile construction and while green are only strong enough to withstand careful handling. Interior of cores is filled with crushed coke and rodded as lightly as practicable; in this case no rod over ¼ in. in diameter is used. These fragile cores facilitate contraction by crumbling under the pressure of the contracting metal, thus avoiding cracks and checks in the casting. Their porosity also serves as a means of venting by allowing gas and air to escape through their interior and pass off through the vent in bottom of core.

Core sand, which forms the exterior of the core, consists of 35 parts of straight silica sand, 10 parts No. 0 Albany sand, and one part oil, by volume; a good linseed oil substitute being utilized for this purpose. This combination, prior to the addition of the oil, is passed through a No. 10 sieve. After adding the oil, the core sand is carefully tempered with water and mixed thoroughly in a mechanical paddle mixer. While resting on a cast iron core plate the core box is removed from the core, thus allowing the core to be transferred to the core ovens on this plate. When removed from the oven, the

FIG. 4—The Finished Casting at the Left Shows the Heads and Gates. At the right is the other side of the casting after machining and ready for assembling

cores are painted while warm with wet blacking. The heat of the core quickly dries the blacking and the core is then ready to set or be placed in the mold.

In some mold assemblies chills are inserted in the cores to obviate the use of shrink heads; and, at times, where feasible, core assemblies are made in order to eliminate fins on the castings. These methods, however, do not apply to the particular casting being described now.

Closing the Mold and Pouring

After the cores are set in place in the drag, the impressions around the lifting hooks are swabbed with oil. These impressions are then filled with facing sand and smoothed over with a slick. All loose sand or foreign matter is then removed by means of an air hose directed over the surfaces of cope and drag. Mold is then closed and poured immediately.

Metal is placed in clay-graphite or carborundum crucibles and melted in anthracite coal-fired, pit type furnaces. When the temperature of the metal reaches 1300 deg. Fahr., it is poured immediately into the mold; the work being scheduled so that the mold and metal are ready at the same time.

Accurate temperature control is employed not only to improve the physical properties but also to obtain a uniform minimum shrinkage. The job is double poured, pouring 50 lb. of metal through each of the two wedge shaped gates.

After pouring, the heads and gates are relieved by removing the sand from around them so that they may be free to move as the casting contracts, and thus facilitate rather than retard the contraction of the casting to avoid internal stresses that might result in distortion. Likewise to prevent distortion, proper time is allowed for cooling before shaking out the casting. Heads and gates are removed by sawing, also a distortion preventative, and then ground to the level of the surface surrounding them. Fins, if present, are removed by grinding.

Fig. 3 is a mold ready to close, in the foreground, and the pattern in place on the follow board, in the background. Note that the hooks have been covered with sand, seen as spots on the cores. The cope shows three round heads or risers, one over each of three lugs; and the two wedge gates which are located near the other three lugs. These lugs may be seen on the pattern. They are to support a motor to be placed on top of the finished casting.

Six of the ten chills used in the mold are located under these lugs. The chilling and feeding of the metal in the vicinity of the lugs is a precaution taken due to the cross sectional area of the lugs being much greater than the casting in general. Nails with large heads are inserted in the cope, hardly visible in the photograph, to chill the metal at the junction of main body of the casting and the three large ribs. Attention is also called to the sturdy construction of cope, drag and pins.

Fig. 4 gives the cope side of the casting showing heads and gates. The other side of the casting after machining and ready to be assembled is also shown. The casting is approximately 32 in. sq., with ribs about 3/16 in. thick.

Machining and Assembling

Machining of these castings consists simply of placing the casting on the table of a milling machines and milling the end ribs or flanges which are to be secured to the duralumin sheets. In the case of castings with lugs or bosses, such as the one described, it is also necessary to mill the faces of the lugs or bosses. Only an average of 0.02 in. is removed from a flange by the milling cutter and no further machining is done except the drilling of the holes. Furthermore this machining is done without laying off the castings.

Holes 17/32 in. in diameter, to accommodate ½-in. bolts, are drilled in the flanges with the aid of jigs or templates. The assembly of the chute is accomplished by securing 3/16-in. duralumin sheets to the flanges of these castings by means of steel bolts previously dipped is asphaltum paint to avoid galvanic action accompanying the association of two dissimilar metals in the presence of sea air. After the bolts are secured, their heads and the nuts are given another coat of asphaltum paint. The chutes when completely erected are painted with aluminum paint and are then ready for use, presenting a very neat fitting assembly of creditable appearance.

By these means, due primarily to accuracy in foundry practice, a great deal of time and labor are saved, thus materially reducing the cost of the finished product.

Many large as well as small castings of intricate shape are manufactured in this manner. For example, a ring shaped assembly approximately 19 ft. in diameter consisting of 18 segments, each an intricate casting, was molded in this manner having only the bolting flanges trued up by milling a maximum of 0.02 in. off each edge of each segment. When erected, this assembly was found to be within a tolerance of plus or minus ⅛ in. in the entire circumference of about 60 ft.; or in other words, it fitted practically perfect. These castings also were not laid out, only the usual milling, and drilling of holes by the aid of jigs or templates.

All castings made in this manner have passed rigid inspection with few rejections, and so this procedure, when closely controlled in all details, may be regarded as eminently satisfactory, practical and economical.

Economic Use of Electric Furnaces

Analysis of Production Costs, Electricity vs. Natural Gas in Heat Treatment of High Grade Shovels

BY WIRT S. SCOTT*

SEVERAL brands of shovels made by the Baldwin Tool Works, Parkersburg, W. Va., may be outlined as follows: Alloy Steel brand, made from molybdenum steel, each shovel heat treated; Optimus brand, made from manganese steel, light weight, each shovel heat treated; Monongah Featherweight brand, made from high-carbon steel, light weight, each shovel heat treated; Pinnacle brand, made from high-carbon steel, standard weight, each shovel heat treated; Knoxall brand, a competitive product, not heat treated.

Steel from which the blades are made is purchased in large sheets cut to specified widths and lengths. In the forge department the sheets are cut first into multiple lengths, as required by the length of shovel blade, and then into rectangular pieces, as required by the width.

To this flat, rectangular piece of steel is welded a strap of soft steel. A flat drop machine is used for smoothing the blade, and it then passes to a trimming machine, where it is cut to exact size. The blade is then heated in a furnace, placed in a die, and by means of a drop, receives its final shape. By a somewhat similar process the strap is shaped to receive the handle.

From the forge room the alloy steel and high-carbon steel shovels go to the heat-treating room, for hardening and tempering. Since the company has had experience with both fuel furnaces and electric furnaces, of the same general type and dimensions, and used in exactly the same manner, a comparison of results is possible.

*Special representative, Westinghouse Electric & Mfg. Co., Mansfield, Ohio.

Heat Treating with Gas

Parkersburg is in one of the most favorable territories for natural gas supply. Natural gas of 1000 B.t.u. value is sold for 32½c. each thousand cubic feet.

Three gas furnaces, rectangular bath type, lead hardening and lead tempering, were installed, one being a spare. Nickel-chromium vessels were used, each about 18 in. wide, 46 in. long and 17 in. deep. Pyrometers indicate the temperature of the bath. Crushed coke was used on top of the baths, to reduce the lead loss.

The record of the heat-treated production, gas, lead and coke consumption for nine months, ended Jan. 31, 1929 is given in Table I.

Electric Furnaces Put In

Two duplicate electric furnaces are installed, each of 65-kw. capacity. This high capacity was not required by the tempering furnace, but the customer wanted both units to be available for either hardening or tempering.

As in the case of the natural gas furnaces, the vessels

QUENCHING Shovel Blades in Oil, Special Jigs Holding the Blades. For large shovels, such as scoops, the heated blade is placed in a form mounted on an elevated hand-operated conveyor, which permits exact quenching without distortion

are made of nickel chromium, 18½ in. wide by 46½ in. long at the top, 14½ in wide by 42½ in. long at the bottom, and 17¼ in. deep. The furnace shell is a heavy plate box with riveted and welded corners, surrounding the insulating and refractory brickwork. The furnace chamber, lined with refractory brick, supports the heating elements on the side walls and on the bottom.

Having wide flanges, the vessels rest on suitable supporting brickwork. After the vessel is in position nickel chromium alloy aprons are placed around, overlapping the flanged sides. Over this is put a heavy iron protective plate, covering the entire brick-work. This plate is cut out so as to expose the vessel and protective apron, but overlapping the apron. This construction effectively prevents molten lead, scale or other materials from getting down into the brickwork or furnace chamber.

Two thermocouples are used with each furnace, one in the bath, the other within the furnace chamber. The protected-type thermocouple in the bath operates a temperature recording and controlling pyrometer. By means of magnetic contactor switches, this functions to control the temperature of the lead bath. The thermocouple placed in the heating chamber is of the bare type, and is connected directly to a temperature control pyrometer.

This arrangement of thermocouples and control not only prevents excessive temperatures building up within the furnace chamber, but operates to reduce the temperature variation or surges within the bath. Fluctuations of temperature within a large bath of molten lead has been a great disadvantage of that form of heating. Unless the temperatures of both bath and heating chamber are under coordinated control, there is no hope of obtaining a sufficient uniformity of temperature for quality production.

Hardening the Product

Shovels are immersed in the lead to a depth of about four-fifths the blade length. An average shovel having a blade 10 in. wide by 12½ in. long by 0.086 in. thick has an immersed depth of 10 in. The weight of this immersed stock is 27 lb. per dozen shovels. The largest shovel heat treated has a width of 15½ in. and is immersed to a depth of 15 in.

A very heavy bed of powdered coke—about 2 in. in depth—is placed on top of the lead. This unusual depth retains the shovel blades down in the molten lead without any other means of holding them. Otherwise special hooks would be required for this purpose, or the shovel held in the bath by hand until heated.

The hardening bath control is set to maintain a temperature of 1475 deg. Fahr., and the tempering bath 700 deg. Fahr. From four to six shovels are placed in the hardening bath at one time, and from 12 to 34 in the tempering bath.

In hardening, one shovel is removed from the bath, and quenched in oil; a blade previously quenched is removed from the quench and placed on a drain board accessible for the operator doing the tempering, an unheat-treated shovel is placed in the hardening bath, completing the cycle. Twenty shovels can be hardened in 4 min., or at the rate of five shovels a minute, but this pace is not maintained throughout the day, since the operator gives a certain amount of attention to obtaining his supply of shovels.

Method of Tempering

Tempering immediately follows the hardening process, but the operation of the furnace is somewhat different. The hardened shovels may be removed from the drain board in batches, and placed in the tempering bath, completely filling the vessel, the shovels nested together as closely as possible for convenient handling. In one case the shovels were nested in two rows, of 18 and 16 shovels. A dozen or more shovels may be removed at one time, and placed in a large box mounted on a truck. A half dozen hardened shovels then take their places in the bath, and the operation continues until the entire batch has been removed from the furnace.

Reloading the furnace or bath then continues until the vessel is again full. The production capacity of the tempering bath is greater than that of the hardening bath, hence the shovels may be tempered at the same rate as hardened.

The electric furnaces were placed in operation Feb. 1, 1929, and meters were installed a little later for measuring the power consumption. The production records for

General View of Gas-Fired Lead-Bath Furnaces

Heat-Treating Department for Hardening and Tempering Shovels. The shovels are heated to 1475 deg. Fahr. in the bath-type furnace in foreground, quenched in oil, and placed on the drain board (rear center) to drip. They are then tempered at 700 deg. in the bath-type furnace shown at right

April (26 days), May (25 days) and June (10 days), are shown in Table II.

Comparing the Results

ANALYZING the production figures for gas and electric furnaces, from Tables I and II, a true comparison can be obtained of many things of importance in determining the relative values of the equipment.

Electric Furnace Analysis

Kilowatt hours consumed per dozen shovels heat treated	4.63
Lead consumed per dozen shovels heat treated, lb.	0.29
Man-hours of labor per dozen shovels heat treated	0.1155
Shovels produced per working hour, dozen	17.50

Gas Furnace Analysis

Gas consumed per dozen shovels heat treated, cu. ft.	70
Lead consumed per dozen shovels heat treated, lb.	0.71
Man-hours of labor per dozen shovels heat treated	0.16
Shovels produced per working hour, dozen	12.90

Heat Energy Costs

In determining the relative costs of electricity vs. gas, April, 1929, was taken as the basis. Electricity is purchased from the public service company, primary power, at $1.10 for every kilowatt of measured demand, plus an energy charge, block rates, varying with the amount consumed. As the purchase of power for other purposes must be done regardless of whether or not the electric furnaces are used, they are here charged with current at the rate of 1c. to the kilowatt-hour, as in Table III.

Using the current rate of $0.0125 per kw-hr. and $0.325 per M for gas, the monthly cost for a production of 4339 dozen shovels will be:

Electricity, 19,840 kw-hr. at $0.0125	$249.23
Gas, 308,069 cu. ft. at $0.325	$100.12

Lead Cost

Since the lead consumption as shown by any one month may not represent accurately the actual consumption, an

Table I—Heat Treating with Gas

Month	Man-Hours	Lead, Lb.	Coke, Lb.	Oil, Gal.	Gas, Cu. Ft.	Shovels, Dozen	Actual Working Hours

Dec.	425	2,318	...	260	185,309	2,654	207
Jan., 1929	497	2,222	...	...	226,360	3,511	243
Total	3,643	16,223	3,825	780	1,606,199	22,802	1,770

Table II—Heat Treating with Electric Furnaces

Month	Man-Hours	Actual Working Hours	Lead, Lb.	Kilowatt Hours	Maximum 15-Min. Demand	Shovels, Dozen
April	481	236	1,200	19,840	63.0	4,339
May	436	214	950	15,880	64.0	3,413
June	172	89	685	7,920	61.9	1,685
Totals	1,089	539	2,835	43,640		9,437

Table III—Power Rate Structure for Electric Furnaces

Energy charge—19,840 kw-hr. at $0.01 per kw-hr.	$198.40
Demand charge—63 kw. demand at $1.10 per kw.	69.30
Total April bill	$267.70
Discounts, 5 per cent for primary service and 2 per cent for prompt payment	$18.47
Net April bill	$249.23

$$\text{Net rate per kw-hr.} = \frac{\$249.23}{19,840} = \$0.0125$$

average figure should be used, based upon as long a period as possible.

	Gas Furnace	Electric Furnace
Lead consumption, lb. per dozen shovels	0.71	0.29
Total for 4339 dozen shovels	3,080	1,260
Monthly cost, at 6¼c. a lb.	$192.50	$78.65

Labor Costs

The men operating the gas furnaces were paid from 45 to 55c. an hour. With electric furnaces, less experienced help could be used. It was stated that young men from various parts of the plant were often drafted to operate the furnaces, and became thoroughly proficient within a day's time.

In the absence of a definite labor rate paid during the operation of the electric furnaces, it is safe to assume that the rate is the same as with gas, an average of 50c. an hour.

	Gas Furnace	Electric Furnace
Man-hours of labor per dozen shovels produced	0.16	0.1155
Man-hours to produce 4339 dozen shovels	694	501
Labor cost, heat treatment of 4339 dozen shovels	$347.00	$250.50

Comparative Production

Production figures are based upon actual working hours required to turn out a given quantity. With gas and electric furnaces of equal size, the production figures given below show the comparative value:

	Gas Furnace	Electric Furnace
Dozens of shovels	22,802	9,437
Actual working hours	1,770	539
Dozens of shovels produced per working hour	12.90	17.50
Working hours required to produce 4339 dozen shovels	336	248

Increased production capacity of electric furnaces over gas furnaces for the given size was found to be 35½ per cent. It is to be noted that the figure of 248 hr. is an average, whereas the actual time was only 236 hr. But, since an attempt is made to set up basic figures for comparison, the average value must be used.

Vessel Maintenance

Maintenance for the furnaces is that due to depreciation of the vessels, and that required for general upkeep. Vessel maintenance is based upon results obtained at customer's plant with gas furnaces, plus results obtained through definite information received from a large number of electric furnaces.

Cost of vessel, installed in pot, was $800. Life of vessel, electric (hardening), is placed at 6500 hr. and life of vessel, gas (hardening), at 2500 hr. Basis for maintenance is April, 26 days, and a production of 4339 dozen shovels.

Electric, working hours	248
heating up, 1 hr. each day	26
Total, hours use	274
Gas, working hours	336
heating up, 3 hr. each day	78
Total	414

Useful life of vessels used up during April was:

$$\text{Electric, } \frac{274}{6{,}500} \times 100 = 4.22 \text{ per cent}$$

$$\text{Gas, } \frac{414}{2{,}500} \times 100 = 16.56 \text{ per cent}$$

Vessel depreciation during April was thus:

Electric, $800 × 0.0422 = $33.76
Gas, $800 × 0.1656 = $132.48

No repairs of any nature were made to the electric furnaces during the past year of operation and they show no signs of deterioration. A general charge of $10 under this item, each month, will amply cover all contingencies.

Based on previous production, and corrected for present production, each gas furnace was shut down four times a year for two days each time for minor repairs. Labor of two men for two days, plus materials, call for annual expenditure of

16 man-days at $4.50	$72	
Materials	32	
		$104

Each furnace was shut down every three months for complete rebuilding. Labor, six days each time, for two men, made

48 man-days at $4.50	$216	
Materials	400	
		$616
Total yearly cost		$720
Average monthly gas furnace repairs		$60

Air for Gas Furnaces

For the gas furnace a 5-hp. motor was required to operate the blower and the pump for circulating the oil quench bath. With the electric furnaces a 2-hp. motor is required for circulating the oil. The saving, therefore, is the power consumed equivalent to 3 hp.

At 314 hr. a month, for a 3-hp. motor at 80 per cent efficiency, the power consumption will be

$$314 \times 3 \times 746 \div 0.80 = 878 \text{ kw-hr.}$$

Monthly power cost for supplying air to gas furnaces:

$$\$0.0125 \times 878 = \$10.98$$

Investment Charge

The three gas furnaces cost approximately $4,500 installed; the electric furnaces, $7,900. With interest and depreciation at 15 per cent, the investment charges are as follows:

Gas Furnaces	
Annual charge on $4,500	$675.00
Monthly charge	56.25
Electric Furnaces	
Annual charge on $7,900	$1,185.00
Monthly charge	98.75

Summary

COMPLETE summary of electric and gas furnace production costs, based upon one month's production of 4339 dozen shovels, appears in Table IV.

Table IV—Total Production Costs

	Electric Furnaces	Natural Gas Furnaces
Electric or gas bill	$249.23	$100.12
Lead consumption	78.65	192.50
Labor for heat treatment	250.50	347.00
Vessel depreciation	33.76	132.48
General repairs	10.00	60.00
Air for gas furnace	....	14.23
Interest and depreciation	98.75	56.25
Total	$720.89	$902.58

William H. Baldwin, president of the Baldwin Tool Works, states that the improved quality of product, the uniformity of results and the ease with which the furnaces may be operated by relatively inexperienced men, make the cost of power a negligible item. Replacement of shovels due to defects not showing up until placed in service, come from many sources besides heat treatment. However, these rejects, from all causes, have been reduced one-fifth since electric heat treatment was adopted.

No. 4 steam generating unit in the East River Station of the New York Edison Co., comprising a 1500-hp. boiler, equipped with water-cooled furnace and air preheater, and fired by the Lopulco storage system for burning pulverized fuel, recently gave a 532 per cent rating for 72 hr. operation.

Nordmarks Iron Mine near Philipstad, Sweden

AN old steel engraving depicting the methods of iron ore mining in another century is here reproduced in THE IRON AGE *by courtesy of the Swedish Iron & Steel Corporation, 17 Battery Place, New York. Mines in the Province of Varmland, where the Nordmarks is located, have been operated for more than 400 years. The pig iron made from its low-phosphorus, low-sulphur ore is used in the production of strip steel for razor blades, clock and watch springs. Most of the razor blades made by a leading American manufacturer have been of steel made from this ore.*

Layout of a Manufacturing Plant

Sequence of Departments in Which Aircraft Engines Are Made by the Wright Aeronautical Corporation

BY FAY LEONE FAUROTE

ONE of the largest organized manufacturing units in the aeronautical industry is the Wright Aeronautical Corporation plant. While less than a year ago it was able to perform its activities in one large building and a part of another, the production demands of this year have made necessary an expansion into a group of twelve buildings, all but one of which lie in a closely connected group between Gray Street and Madison Avenue, immediately adjoining the main line of the Erie Railroad at Paterson, N. J.

Plant No. 1 has 10.5 acres and a manufacturing floor area of 502,345 sq. ft. Plant No. 2, some distanee southeast and on the other side of the Erie Railroad, contains 17.4 acres and a floor area of 128,000 sq. ft., the main building being a new foundry recently put into operation. There is available here for future development a space of 15.6 acres.

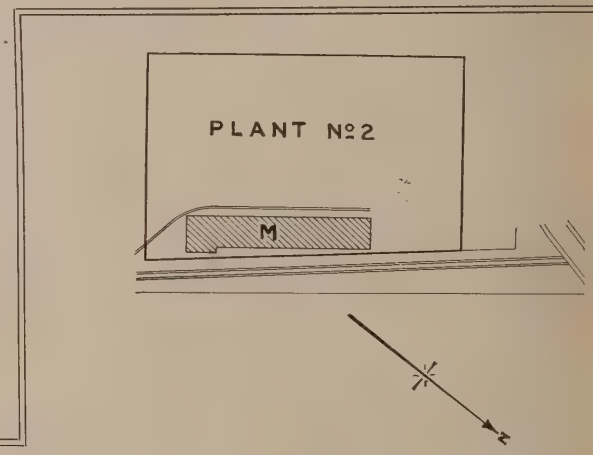
Composed of concrete, steel, brick and glass, the buildings are modern in every respect, and exceptionally well lighted. The machinery is grouped so that there are large aisles along each wall and through the center. Physically this gives the whole plant an airiness and spaciousness which is delightful. One has the feeling of being in a tool room rather than in a manufacturing establishment. Much of the machinery is new and of special design. The men are high-grade and skilled.

Plant Laid Out for Flexibility

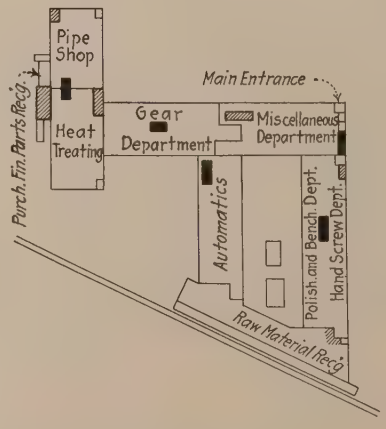
Guy Vaughn, the general manager, evidently has had the vision of a rapidly growing industry and has laid his foundations for a system of mass production and unit assembly which will make the shop not only presently efficient but capable of being adapted readily to new models.

Many of the special drilling tools, multiple drills, Bullards, automatics, lathes and grinders have been set up for a specific job, but, because they have standard heads and have been designed and assembled from standard parts, there will be little difficulty in keeping this factory in that state of flux which any rapidily growing industry such as the aeronautical seems to demand just at present.

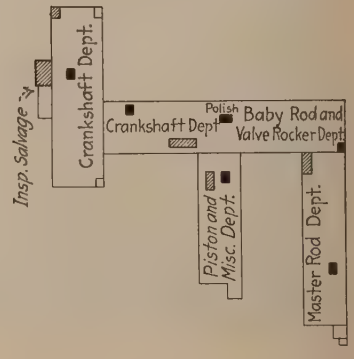
A glance at the accompanying diagrams will show the efficient manner in which these various departments have been laid out. Generally speaking, the work progresses



ARRANGEMENT of Principal Manufacturing Departments Is Shown on the Four Floor Plans at Right. These include buildings A, B, C, D and G, as indicated on the general plant layout above them. The new foundry, M, was described in THE IRON AGE of Dec. 12 and 19. Locations of inspection stations and work assignment stations are brought out clearly in our drawings



FIRST FLOOR



SECOND FLOOR

in an orderly procession from rough stock to finished component, the emerging streams meeting at proper points to facilitate later operations and minor assemblies. While the amount of production has not yet reached a point where conveyor systems and the other paraphernalia of intensive mass production are necessary or can be used with profit, there is the beginning of a hand-operated assembly line.

Engines are mounted on special assembling frames equipped with wheels so that the whole unit may be moved along the track as the work grows. Of course in some departments it has not been desirable to locate machine tools in productive order; the amount of work of one form or of one model is not large enough to make this desirable. But in such bays as those devoted to the manufacture of the crankshaft, cylinder and cylinder head, master rods and "baby" rods, crankcase, piston and valve rocker arms, one may see the production sheet visualized in the line of machine tools which makes the steps of production easier to follow.

Arrangement of Departments

Beginning with the first floor, one enters a miscellaneous department, traversing a gear department and two other wings filled with automatics, polishing and bench work, a hand-screw department, a raw material receiving room, a pipe shop and a heat-treating department. The latter has been recently installed, the inadequate old department having been torn out some months ago. There is on this floor also, but in another building, a production test, a main assembly and the final test.

Climbing a stairway to the second floor, the visitor sees the crankshaft department, passes through a polishing section, and the "baby" rod and valve rocker departments. In the wings extending to the south are the "master rod" department and a floor devoted to piston and other miscellaneous parts. The third floor is almost entirely devoted to crankcase and cylinder production. The general offices, engineering department, factory offices and experimental department occupy the greater proportion of the fourth floor, although there is a northwest wing containing a tool room, machine repair, tool inspection and main crib.

Engaged as they are in the manufacture of a precision power plant upon which the lives of pilot and passenger alike are dependent, Wright workmen seem to sense their moral obligations to the public. All their methods and forms of inspection are characteristically fine. Unusual means are taken to maintain the integrity of castings and forgings, and the special alloys of aluminum and steel are made up according to formulas which rigid tests and experience have set up as adequate.

In an article devoted to the Wright foundry and Wright foundry practice the manner in which the intricate crankcase and cylinder head castings are made is described and discussed. The Wright Corporation makes all of its own castings, so it may control to a nicety the initial production of these important components.

Forgings for important steel parts, such as the crankshaft and the connecting rods, are purchased outside, but manufactured under the scrutiny of Wright inspectors. So much metal is taken off in the process of machining that there is little opportunity for a defect to get by. Furthermore, there are adequate tests and inspection between successive machining operations and a gruelling production test. And the engine is completely disassembled again, carefully inspected and reassembled preceding a final test, before it is turned over to the shipping department for its final touching-up, crating and delivery.

While many of the operations on smaller parts show little divergence from characteristic automotive work of a fine quality, yet there are some six or seven major parts whose method of fabrication is worthy of detailed description. Hence they were given in detail in a series of articles in THE IRON AGE of July 18, Aug. 8, Aug. 15, Aug. 22, Aug. 29 and Sept. 5, 1929.

Making Motor-Bus Bodies of Steel

Die Costs Limit This to Multiple Production— Sheets, Formed to Shape, and Tubing Are Large Factors

BY FRED L. PRENTISS*

MOTOR-BUS transportation has gained so rapidly the past two or three years that there has been a steady increase in the production of buses. The manufacture of bus bodies has thus become well established as an important branch of the automotive industry. And the larger output of buses and the greater demand for bodies has enabled bus-body manufacturers to develop their methods with a view to increasing efficiency in production, and to make considerable progress in standardization.

There were 9000 motor buses built in this country in 1928 and the number now in operation is placed at 92,000. These figures indicate the importance which the industry has attained.

Developments of passenger bus transportation include the formation of large bus companies through the merger of small companies serving comparatively small areas, and the entrance of the railroads into the bus transportation field. It is stated that 72 railroads are now furnishing motor-bus transportation. The tendency toward the operation of buses in larger fleets than formerly has resulted in some standardization of motor-bus equipment by the transportation lines, working in cooperation with bus and body manufacturers.

Steel Dies Require Multiple Units

The steel industry has profited by the movement toward standardization in the bus-body manufacturing industry. When bus-body orders were for single or, at most, for very few units it was difficult for the steel bus-body frame to compete with the composite body made of wood reinforced with steel. If only a small number of bodies of a certain design was wanted, it was much cheaper to make them of composite material, as the expense of making dies for a few units made the cost of steel frames almost prohibitive.

INTERIOR of Assembled Body Frame. Longitudinal square tubing (top, center) carries baggage racks at sides. Roof rafters are at alternate pillars

In addition, bus-body makers had to meet and overcome resistance to a change, the same resistance that the all-steel body met in the automotive industry a few years ago.

Standardized Steel Sections Used

Bus bodies having all-steel frames made of standardized sections are being manufactured by the Lang Body Co., Cleveland. These lack little of being all-metal bodies, as their outer covering is of aluminum and practically the only wood is the flooring and wood fillers on the inside, the latter serving as a deadener for noise and for attaching the interior finish of wood, leather or velour. While the metal frame, weighing 1800 to 2000 lb. for a large bus, is heavier than the composite frame, it is stated that the finished bus body having a steel frame is as light as one with a composite frame built according to specifications identical except as to frame material.

Advantages claimed for the steel-frame bus are its greater strength and safety to passengers in case of accidents. While manufacturers expect a longer life of a bus body with a steel frame than from the composite

*Resident editor, THE IRON AGE, Cleveland.

frames, the steel-frame buses have not been in service long enough to substantiate this claim.

The frame of the Lang body bus is made of steel sections standardized in form, but varying in size and length, depending on the type and size of the bus. The main sills, which extend the length of the frame at the bottom of the two sides, are deep Z-sections, to which curved sections serving as the wheel housings are riveted and spliced near the rear end. To the sills are fastened uprights or pillars of channel form. Attached near the top of the pillars and extending the length of the body is a roof rail. This is a pressed channel section in which are lightening holes with a minimum diameter of 2¾ in. The holes also provide an opening through which a hand and tool can be inserted to hammer out dents that may be made in the outer metal covering during service.

Channel sections extend the length of the sides between the pillars at a point a little below the windows. The main sills are inside the pillars above the chassis line. On the outer side of the pillars, or along the outside of the body, are pressed steel buffer rails which serve as a brace to the chassis and relieve the sills of shocks that might be caused by collisions.

Rafters extending across the top of the frame for supporting the roof are attached to alternate pillars. Longitudinal members of square seamless steel tubing extend two-thirds the length of the bus beneath the rafters, for carrying the baggage rack. This is formed by similar sections connected to these longitudinal members and to the pillars. The various fabricated parts used in the construction of the rafters, baggage rack and supporting members for the roof are joined together by aluminum castings to which the steel members are riveted. The roof, which is of Haskelite, extends from roof rail to roof rail.

Under the frame at each chassis outrigger a cross sill made of a pressed channel section is riveted to the sills and bolted to the chassis outrigger. These serve as ties for the body and as bolting members for fastening the body to the chassis. The frame members are all joined by hot riveting, except a few minor joints which are welded because of their inaccessibility for riveting.

Formed Sheet Steel Used Largely

The pillars of Toncan steel and other metal parts exposed to weather are of that steel or aluminum. The side and cross sills and roof rails are of blue annealed sheets. The rafters are of metal furniture sheets. Sheet steel of various thicknesses is used for the different members, ranging from No. 12 gage to ¼ in. for cross sills, No. 13 to No. 10 gage for side sills, No. 16 to No. 12 gage for the pillars and for the roof rails. The outside paneling is No. 14 gage, one-half or three-quarters hard, gray sheet aluminum, which is bolted to the steel frame. There are no exposed bolt heads, as these are covered with hollow molding of aluminum or steel.

In manufacturing the steel frame sections steel templets are used in the blanking, punching and forming operations. This practice has been adopted to assure a duplication of holes and parts so that all service parts ordered for replacement will be exact duplicates of the originals.

All parts requiring holes are punched flat. All forming is done with the work located by holes, instead of having the edge of the sheets come in contact with a stop on the press. Certain holes are located for jig holes and, when possible, these are used also for structural holes. The jig is a permanent, adjustable fixture attached to the front and back of the press.

All templet holes are ⅝ in. in diameter, regardless of the size of the hole to be punched in the sheet. The templet is clamped to the blank and the holes are punched on a press equipped with a 4-gag punch holder, designed for use in punching holes in four sizes, one at a time. A ⅝-in. spring plug is used to locate the holes. By the methods followed both speed and accuracy in punching holes have been increased.

The set-up for the forming operation with the use of templets requires more time but, it is stated, results in more accurate work. The various operations involved in the making of parts are done without the use of blueprints. However, blueprints are used in the assembling operations.

Sub-Assembly Method Employed

A complete bill of material is kept for each part, as well as a drawing record, which shows the location of the parts. Every part is detailed on a bill of material and bears a number which is used in ordering service parts.

Sub-assemblies are made of the larger units that form the frame. These are the sills, the roof rails, pillars and wheel housings. These four units are brought together in box-type, adjustable assembly jigs where they and other minor parts are put together to form the final assembly of the frame. The parts and frames when completed are handled by hand hoists operated on two runways above the assembly line. When the assembly is completed the frame is lifted from the jig and placed on a dolly, on which it is moved to the painting room.

All parts of the frame are given two coats of asphalt paint. Each part is dip painted before assembly and the second coat is applied after assembling.

Offsetting Peening Action on Overhead Tramway Rails

FOR many years it was thought that the reason for the flange of an overhead carrying rail turning down was because the rail had been overloaded. This theory has long been exploded, according to E. T. Bennington, Cleveland Electric Tramrail Division, Wickliffe, Ohio, speaking at an engineers' meeting in Akron. If an overload were to cause the flange of the beam to turn down, it would turn down the first few days that such a system was in service. But it has been learned in practice that the turning down of the flange does not occur for a considerable period after the system is installed, and until it has been subjected to a great many passages of load-bearing wheels.

Only four ways are known to the author to provide a rail for an overhead system that will not be rendered useless in a short while by this peening action. Three of these are varying methods of providing separate wearing surfaces and attaching them to the lower flange of the I-beam (or equivalent) carrying the load. The fourth is a type of rail used by one manufacturer specializing in the construction of tramrail systems. This is rolled in one piece, and made of high-carbon steel. It provides a flange which will not be distorted by peening, although peening still takes place the same as it will in all of the shapes and suggestions offered.

In all four types the metal which is peened or expanded works off the rolling surface in the form of the flange without distorting the shape and without rendering it unfit for continued use.

Types of American Alloy Steels

Survey Gives Tonnage of Ingots and Castings Made in 1928—Some of the Uses

BY EDWIN F. CONE

INTEREST in knowing how much alloy steel of different types was made in the United States encouraged the making of a canvass of the 1928 production. Only open-hearth and electric steels were covered. The survey has given data for about 81 per cent of the ingot output and over 98 per cent of the alloy steel casting output.

The production, as compiled from the replies received from producing companies, and here tabulated, classifies 2,410,356 tons of alloy ingots (80.8 per cent of the 2,983,365 tons of open-hearth and electric steel recorded by the American Iron and Steel Institute) and 160,911 tons of alloy steel castings (98.7 per cent of the 163,236 tons of open-hearth and electric alloy steel castings made in 1928).

American Output of Open-Hearth and Electric Alloy Steel in 1928—Gross Tons

Type of Steel	Ingots	Castings
Nickel	125,444	2,179
Chromium	302,204	9,453
Chromium-nickel	235,887	25,720
Molybdenum	1,075	175
Chrome-molybdenum	60,993	7,104
Nickel-molybdenum	108,934	542
Nickel-chrome-molybdenum	16,653	1,726
Vanadium	15,958	417
Chrome-vanadium	160,415	167
Medium manganese (1 to 2 per cent min.)	231,185	30,414
Hadfield's manganese	7,098	51,504
Copper	868,501	10,712
Copper-molybdenum	67,214	.....
Molybdenum-manganese	2,153	1,450
Others	206,642	19,348
Unclassified	570,009	2,325
Open-hearth	2,629,703	83,802
Electric	353,662	79,434
Total	2,983,365	163,236

Copper and Chromium Steels Lead in Ingots

THE large quantity of copper-bearing steel ingots made in 1928—868,501 tons—heads the ingot alloy output. This is a measure of the extent of the copper-bearing sheet industry.

Second to this comes the chromium steel ingot output—302,204 tons—reflecting in part the production of stainless iron. If the production of chromium-nickel steel ingots is also considered in this classification, then over 536,000 tons of such steel is largely the rust-resisting steels—the stainless steels and the high-chromium-nickel steels. Of course, in these totals there is included the lower alloy steels, of which no small quantity is made.

Of considerable importance is the so-called medium-manganese steel, containing 1 to 2 per cent manganese —231,185 tons of ingots. There is an increasing demand for this grade.

The Molybdenum Alloy Steels

Another steel which is comparatively new is the nickel-molybdenum steel, of which 108,934 tons of ingots were reported for conversion into rolled products and forgings. Still more recent is the molybdenum-manganese steel, of which 2153 tons was reported, a steel of which probably more will be heard in ensuing years.

Probably the 67,214 tons of copper-molybdenum steel represents some alloy steel rails which are being experimented with by some of the American railroads.

That vanadium is a large factor in the alloy steel industry is partly brought out by this survey in that over 176,000 tons of ingots were made last year in which this element was incorporated.

Many Special Steels Are Made

Under "other" alloy steels in the table, the 206,642 tons of ingots and 19,348 tons of castings include high-speed steel, nitralloy and special compositions not embraced in the other classifications. There are a great many such steels, one company enumerating such compositions as manganese-copper; high aluminum; copper-chromium and nickel; silicon and manganese; nickel, vanadium and chromium; silicon; molybdenum, chromium and vanadium, and so on.

Features of Alloy Cast Steels

IN alloy steel castings the feature is the large production of Hadfield's manganese steel (12 to 14 per cent Mn.) at 51,504. If the output of converter foundries were added to this total, it is probable that this would approximate 55,000 to 60,000 tons.

Outside of the high-manganese castings, which have been made for many years, the most important seems to be the chrome-nickel composition of which 25,720 tons was made last year. Some of this is the corrosion and heat-resisting material. Probably the 9453 tons of chromium castings includes the major part of the alloy steel, frogs and switches produced.

Attention may be called to the 7104 tons of chrome-molybdenum and the 1450 tons of molybdenum-manganese castings as well as the 10,712 tons of copper-bearing castings.

Chromium Leads Among Alloying Metals

The extent to which the four chief alloying metals were used in 1928 as alloys in steel may be summarized as follows in gross tons:

	Ingots	Castings	Total
Chromium	615,737	160,415	776,152
Nickel	486,918	30,167	517,085
Molybdenum	257,022	10,997	268,019
Vanadium	176,373	584	176,957

These data do not include all such steels, for the classification "other steels" embraces some containing each of these alloying metals.

Some of the Industrial Uses

IN response to the question as to the industries to which alloy steels are sent, the replies were exceedingly varied. Only a few of these are worthy of attention, as many of the uses to which alloy steels are put are generally known.

A large company making several varieties of alloy steel ingots indicated that its products went to more than 15 types of consumers, including automotive products and parts, car builders, agricultural implement manufacturers, ship builders, structural steel fabricators, culvert, roofing and tank manufacturers, fence and other wire products, razor blade makers, industrial machinery manufacturers, makers of shafting, drop forgings, springs and axles, not to mention tool steel and castings for steel plants and rolling mills.

Another large alloy steel producer, making principally ingots and a few alloy castings, sends its products to the oil, chemical, machine tool, mining and milling industries, as well as to public utility companies. A concern having a small alloy casting output states that some of its products go to the ceramic, electrical and general stamping industries. A great deal of alloy steel ingots ultimately find their way to incorporation in shear knives for the sheet metal and tin plate industry, according to a large electric alloy steel ingot maker.

Several companies on the Pacific Coast report that their alloy steel ingots and castings are finally used in the sawmill and logging industries. Still another producer, which makes open-hearth and electric alloy steel ingots only, indicates that its products

are for chain makers and ball bearing manufacturers, and automotive, machine tool and tool steel consumers. That a considerable quantity of alloy steel ingots is finally incorporated in thermostatic equipment and magnets and in saws, knives and other edge-cutting tools is the testimony of a representative alloy steel ingot producer.

A Western producer of many grades of steel ingots and castings, both alloy and plain carbon, reports that its large output of copper-bearing steel is furnished to the Navy for use for special purposes and that some of its copper-bearing ingots are converted in its own mills from sheet bars into sheets. Some of its chromium-nickel castings are furnished to makers of oil-well machinery as pressure castings.

A representative producer of the high-chromium-nickel steels supplies the electrical, oil, chemical, paper, kitchen equipment and architectural industries.

Among the makers of alloy steel castings, one in the Far West serves paper making, cement mills and vegetable oil mills, as well as the mining and logging industries. A Texas steel foundry reports that all its chromium-nickel alloy castings go to the petroleum industry. For heat, corrosion and abrasion-resisting conditions, another company furnishes chromium and chromium-nickel castings, while an electric alloy-steel maker sends chromium-nickel castings to a steam hammer manufacturer.

A recently organized electric steel foundry makes six grades of alloy steel castings for crushing and grinding equipment, dredge-pump parts and equipment for cement plants. A large Eastern company which makes valves uses certain alloy castings, principally chromium-nickel, in its own product, and a Middle West foundry sends alloy steel castings to furnace manufacturers and heat-treating plants.

Alloy steel castings, made by a Pennsylvania foundry, are furnished to gear makers and steam and electric shovel manufacturers, a large proportion of these being medium-manganese steel. Builders of rolling-mill machinery, hydraulic and special machinery are obtaining a large quantity of chromium-molybdenum and manganese-molybdenum castings from a Middle West foundry. A small foundry reports that its chromium-nickel, nickel and plain vanadium castings are being sent to seamless tube mills.

Prospects for the Industry

QUITE general is the testimony of several of the reporting companies that the prospects are excellent for a largely increased production of both alloy steel ingots and castings. This is particularly true in the stainless field, orders for such steel now being very heavy.

It is undoubtedly true that the statistics of the American Iron and Steel Institute do not fully reflect the entire alloy steel production of the country. This is due to some misunderstanding as to just what an alloy steel is. Some contend that where the alloying element is used in only very small proportions, around 0.25 per cent, such as in the case of the carbon - vanadium, carbon - molybdenum and the "copper-bearing" steels, that these are "semi-alloy" steels and should not be included. Some producers of the medium-manganese rail steels, a large amount of which is made each year and the consumption of which is growing, are not included in the statistics of the institute.

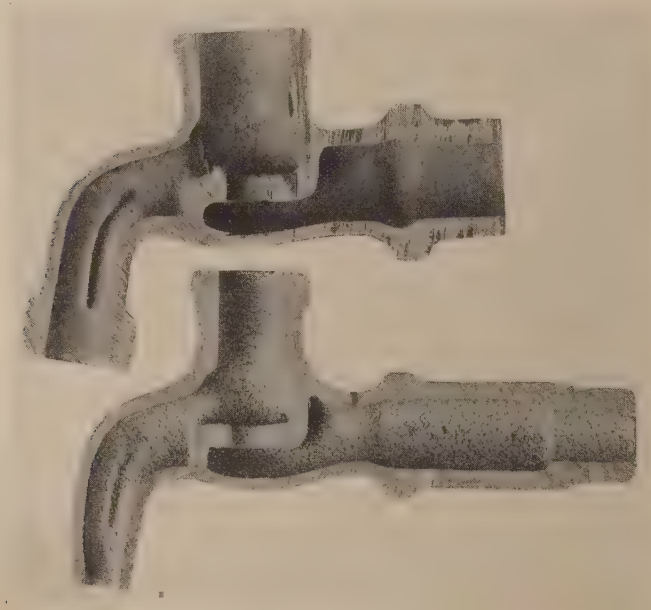
A plea for the clarification of this matter is urgently made. While the statistics gathered in the foregoing survey may not coincide in every particular with the data published by the American Iron and Steel Institute, it is felt that they are representative of the industry in general and therefore have some value as indicating trend. Only two or three important producers failed to reply to the questionnaire.

Core Preparation to Improve Castings

A NEW method of treating cores and molds in the production of castings has been devised by the Sherman Corporation, industrial engineer, 292 Madison Avenue, New York.

The method uses a highly volatile liquid vehicle diluted with various soluble binders to stiffen the surface filler material, preferably red talc, and the coating may be applied in varying thicknesses, due to infiltration; it dries quickly and is non-inflammable. Thus far the method has been used largely on dry sand cores and molds, and with cores having either a gluten or an oil binder or a combination of oil and other binders. While the method is particularly useful in brass foundries, due to the cutting-in of the metal into cores and molds, it offers interesting possibilities for ferrous work.

Demonstration has indicated that the work of cleaning castings, through this Sherman core treatment method, is reduced materially, running from 15 to 25 per cent less. Treated cores and molds do not absorb moisture and may be stored indefinitely. Sand blasting of all cored work has been reduced to much less than is required without the treatment.



Casting (Above) Made with Core Treated by the Sherman Method. By contrast the other was made with an untreated core

Avoiding Lost-Time Accidents

The Carrie blast furnaces at the Homestead Steel Works of the Carnegie Steel Co., Homestead, Pa., were operated from March 2 to Oct. 27, 1929, a period of 238 days, without a single lost-time accident. The average working force during this time was approximately 850 men, and the actual hours worked, 1,772,680.

During this period 1,066,110 tons of pig iron was produced and 94,548 cars were handled, including 36,008 ladles of molten iron and 26,190 ladles of molten slag. W. S. Unger, superintendent of the Carrie furnaces, was recently given the Johnson Award for outstanding blast furnace practice by the American Institute of Mining and Metallurgical Engineers.

Insulated Open-Hearth Furnace Built

Excellent Operating Results Reported for Unit Encased in ¼-In. Plate to Avoid Infiltration—Electrically Controlled Reversing Valve

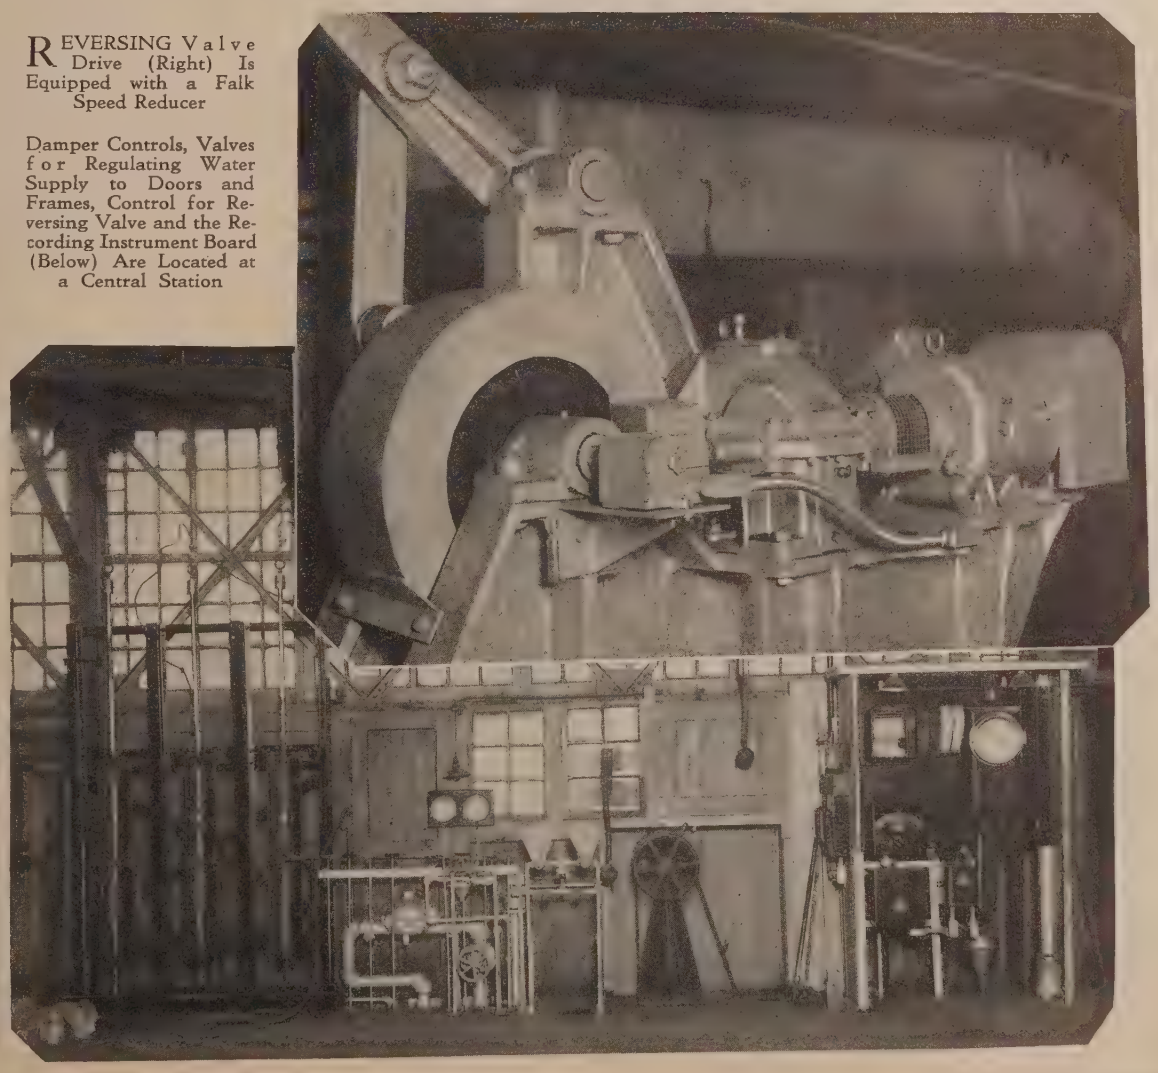
AFTER 550 heats no repairs have been made on roof ends, front and back walls or checker chambers of a 25-ton open-hearth acid furnace which was designed by the Freyn Engineering Co., Chicago, for operation by the Falk Corporation, Milwaukee. This is an oil-fired unit, which measures 12 x 44 ft. The average fuel consumption, when operating at capacity, is 35 gal. of oil per ton of metal.

Foundations under the checkers, flues and the valve are insulated with approximately 3 in. of Sil-O-Cel C3 furnished by the Celite Products Co., Los Angeles, Cal. In addition to the Sil-O-Cel, two courses of 9-in. standard firebrick complete the foundation. The checker chambers are encased entirely with ¼-in. steel plates. These chambers are surrounded with an 18-in. wall consisting of 4½ in. of insulating brick C-22, 4½ in. of firebrick and 9 in. of standard silica brick. The insulating brick were brought up to the skewback of the checker chambers. Inside, the checker chambers are 14 ft. 6 in. long and 11 ft. 5 in. wide.

Each chamber roof consists of 3 in. x 6 in. x 12 in. silica brick with 17-in. crown, covered with one course of insulating brick C-22. Each chamber has 17 courses of 9-in. brick, consisting of 13 courses of firebrick and four courses of silica brick. Two 5-in. peephole doors with colored glass give the furnacemen a good view into the chamber.

The bath is made up of six courses of brick as follows: one course of insulating C-25 brick running up both ends of the bath pan, two courses of firebrick laid in fire clay, three courses of 9-in. standard silica brick, allowing the usual expansion of ¼ in. This gives the bottom a thickness of 15 in. of brick plus 11 in. of silica sand to complete the bath for operation.

Slag pockets and uptakes are encased with ¼-in. steel plate. The



REVERSING Valve Drive (Right) Is Equipped with a Falk Speed Reducer

Damper Controls, Valves for Regulating Water Supply to Doors and Frames, Control for Reversing Valve and the Recording Instrument Board (Below) Are Located at a Central Station

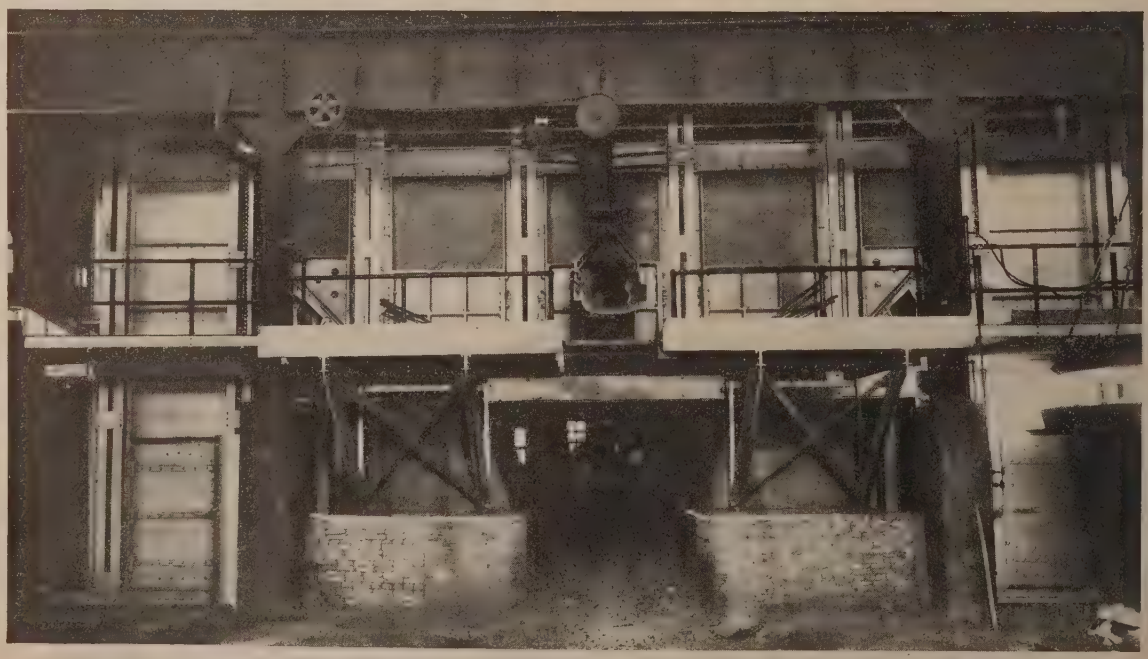
This Furnace Is Encased in a Steel Jacket. The doors and frames are water cooled

only parts not encased are the ends and part of the backwall. Openings in the uptakes are 41 x 42½ in. The slag pockets are 5 ft. wide. The bulkheads are protected with heavy steel doors lined with Sil-O-Cel 3 cement. The walls, which are 18 in. thick, are lined with silica brick laid in a thin silica cement dip. This method of laying the silica brick provides about 1/32 in. between bricks, plus the usual expansion allowed. Avoidance of infiltration of cold air, in addition to proper insulation, has decreased losses over Sunday shutdowns and has increased the speed of heats.

Among the features of the furnace, the doors have been in service for six months without relining. Water temperature at doors and frames averages 150 deg. Fahr. Three 7-in. diameter x 45-in. stroke air hoists are used to operate the doors, one hoist for each.

A water-cooled Nye reversing valve (rocker type) is entirely electrically controlled from the furnace platform and has a type 5DA Falk speed reducer. Air is furnished by a No. 4 Buffalo duplex conoidal fan with two Timken bearings, mounted on a standard subbase for a direct-connected motor. The fan is driven by a 5-hp., 230-volt d.c. adjustable-speed shunt-wound motor, having a Falk-Bibby coupling. The motor is controlled from the furnace platform by a d.c. starter.

The damper, inclosed in a steel frame, is controlled from the furnace platform. A gage regulates the height of damper and thus controls the stack draft. A superheater placed in front of the stack damper serves to superheat steam or air for atomizing the oil. This furnace has a recording pyrometer which gives the temperature at the stack damper, an automatic CO_2 recorder, and a draft gage.



The Walls, Which Are 18-In. Thick, are Lined With Silica Brick Laid in a Thin Silica Cement Dip

Opposition to New Duties on Graphite

American Importers, Grinders and Crucible Manufacturers Say Additional Duties Are Needlessly Burdensome Because Local Graphite Is Unsuitable

THE Senate in revising the tariff bill has made a grave mistake in allowing Senator Black of Alabama to enter a clause classifying "crystalline" and "flake graphite" under one head as "crystalline graphite," and placing a 2c. a lb. duty on it, according to a statement by H. M. Riddle, Jr., vice-president, Asbury Graphite Mills, Asbury, N. J.

Since 1922 crystalline graphite has carried a duty of 20 per cent ad valorem and flake graphite a specific duty of 1.5c. a lb. Before that time, graphite carried no duty. The present bill would mean an increase in duty on the highest types of crystalline plumbago from approximately $29 a ton to around $44.80 per ton, and on the lowest grade from an average of $7 per ton to $44.80, an increase of over 600 per cent.

These figures are opposed by a group of American companies engaged in the importation of graphite, and its grinding (whose spokesman Mr. Riddle is), particularly in view of the fact that American flake is today being offered at lower prices than the foreign product, and also since the increase is more than asked by the company producing 87 per cent of the flake graphite mined in this country in the last three years. In the hearing before the Ways and Means Committee it asked for a continuation of the present duty.

Efforts to Use American Graphite

As American flake graphite does not compete in quality or price with Ceylon or Madagascar graphite, Mr. Riddle's confreres can see no reason for a duty of any kind on this product. Ceylon graphite is of crystalline nature; it comes in several distinct formations which, with different characteristics, are suited for different products. Madagascar graphite, while of flake structure and resembling the American flake, is different in physical characteristics, flake size and structure. For these characteristics, nature itself is responsible. The types have not been found to be interchangeable.

American produced graphite is not an unknown material to any of the industries, neither does it represent a very young industry. It has been on the market for over thirty years and some of the crucible manufacturers and graphite grinders worked with it continually during that time.

It has been claimed by the Southern interests that American graphite has not been used by crucible manufacturers because of antagonism, lack of interest or price. Mr. Riddle states that all crucible manufacturers have tried to use it and they are today paying approximately 40 per cent more for the highest grade of imported graphite than is asked for the highest grade of American. These manufacturers are producers of crucibles of the highest quality. It is not reasonable to assume that an industry where cost must be kept down would pay this premium unless necessary. Yet a survey of the crucible industry showed that the total amount of domestic graphite used by all crucible manufacturers does not exceed 2 per cent of the total requirements, and this quantity is used in special products only.

The largest stove polish manufacturer in the United States (producing approximately 80 per cent of this country's requirements) and one of the largest users of graphite states "that regardless of the duty placed on imported graphite we will have to continue to use it, because we find it makes a much better stove polish than any domestic graphite."

Properties Required by Manufacturers

In making a graphite foundry facing the material must be pliable, unctuous and yet not claggy (sticky). These qualities are found to the highest degree in the foreign product but which, according to Mr. Riddle, do not appear in domestic graphite, which contains objectionable impurities, is harsh, has no body and is, therefore, unsuitable for foundry facing. In this connection the United States Government in issuing specifications for green sand foundry facing stipulates "Ceylon plumbago."

Several reports issued by the Department of Commerce, Bureau of Mines, shows this unsuitability of domestic graphite. The following is quoted from page 28 of Circular 6118, issued April, 1929:

> Some of the amorphous graphite mined in the United States has been nothing more than shale or slate, containing only enough carbonaceous matter to make it black. Other qualities grade into anthracite. Usually it is the physical character of the product that is of utmost importance, and the value of crystalline graphite depends upon its structure and upon the size of the particle quite as much as upon the carbon content. Flake finer than 90 or 100 mesh, for example, is not acceptable to crucible makers, and much larger flake (up to about 12 mesh) is desired.

The following is taken from Circular 6122 of May, 1929:

> American graphite deposits, though numerous and often large, are characteristically low grade. They constitute an abundant source of potential supply, but in normal times they have proved relatively costly to work, and even at the same price, the various products (domestic) never have been able wholly to displace certain imported qualities, notably crucible grades from Ceylon and pencil graphite from Mexico.

That circular has the following to say regarding Alabama graphite:

> The rock is largely quartz with some mica and apatite, and with rarely more than three or four per cent graphite. More efficient milling has made possible a 75 per cent recovery from rock containing only 2 per cent of graphite, the yield per ton being about 25 lb. of graphite.

California graphite is treated as follows in the circular:

> The smallness of the flake makes it of little value for crucibles and refractories.

Further information is given in Circular 6124 published in May, 1929:

> According to one authority, fully 600 graphite mines have failed in the United States, and the records show that of all these properties, scarcely a score have succeeded in operating for as much as a year or two. Throughout the country, in fact, there are scarcely a dozen States in which efforts have not been made at some time to exploit graphite deposits. Failures inevitably occur in all kinds of mining, but the disheartening feature of the record is that so few ventures have paid back the money put into them and none has been a conspicuous success.
>
> The graphite industry, it should be remembered, is in many respects a complicated one. Attempts to state its problems as broad generalities tend to obscure the facts that there are three or four wholly different types of graphite with several grades of each type. Moreover, graphites of nominally the same grade may not be interchangeable because of differences in purity and physical conditions.
>
> Both Alabama and Pennsylvania graphite dust (and flake) were said to be of inferior refractory quality because of their large silica and mica content which fuses under heat.

Further Consideration Urged

The consumers of graphite feel that Congress cannot fully understand this question or they never would burden the country with a duty on a commodity that cannot be produced here. No industry would go half way around the world to Ceylon and Madagascar, carry large stocks of crude material which ties up capital for from six to 12 months, and pay higher prices, if it were possible to use the material found at home. The American importers and grinders are therefore urging a further consideration of this question.

Easy Crane Control by Push Buttons

Accurate Spotting for Riveting Work, Saving in Labor and Increase in Production Reported

ELIMINATION of one man from the working crew and an increase of 25 per cent in output has been accomplished by the installation of a push-button control on a 40-ton riveting crane in the plant of the Lasker Iron Works, Chicago. The crew in this hydraulic riveting tower now numbers three men, including the rivet heater. The essential requirement on this installation was a flexible and delicate control which would quickly spot boiler shells, stack sections and other cylindrical work at 3-in. intervals for riveting in a bull riveter.

Equipment in this tower consists of a 40-ton overhead electric crane, the runway rails of which are 75 ft. above the floor, and three hydraulic riveting machines.

Three separate and independent push-button control stations, one at the control point of each bull riveter, are interlocked in such a way that only one set of push buttons can be used at one time, the others being thrown out of commission by an electric switch. Each push-button station has six push buttons; one for hoisting, indicating the hoisting direction; one for lowering; one for stopping, and three for first, second and third speeds.

An interesting part of the application is that for inching, or spotting at 3-in. intervals. The first-speed button is touched, after which, by pushing the stop button, the operator is able to stop exactly at the right point. For passing a seam of rivets to the next row, a distance of 2, 3 or possibly 4 ft., the operator uses the second or intermediate speed. For high-speed hoisting, as in normal work, the third or high-speed button is used. Incidentally, the problem of feeding current into the motor when the high-speed button is pushed is taken care of by means of a special control arrangement, whereby the motor is fed from the first or second bank of resistance before going across the line into high speed. This is done automatically by the switch arrangement.

The operation consists of very short movements repeated rapidly. The material to be riveted is spotted for the first rivet. The motor is then stopped, the rivet is driven in and then the motor is started again to move the material to the desired location for the next rivet and the operation is repeated many times.

This Push-Button Crane Control Provides Flexibility in Quickly Spotting Work at a Bull Riveter. Its use has cut labor cost and has increased production

How the Results Are Obtained

The motor used is a 60-hp., 220-volt, 3-phase, 60-cycle, slip-ring type, and speed control is obtained by the use of resistance inserted in the secondary winding. The resistance is under the control of magnetic contactors so that the amount in circuit at any one time may be varied and the speed changed accordingly. Three speeds are obtainable.

The control panel consists of a pair of three-pole magnetically-operated direction contactors which are mechanically interlocked one against the other, so that it is impossible to close more than one at a time. In addition to these, there are two three-pole magnetically-operated contactors for governing the amount of secondary resistance which is in circuit at any one time. Protection against overloads is secured by the use of a thermal type overload relay. There are also four small control relays used to obtain the proper functioning from the push-button station.

Push-button equipment consists of one push-button station having a forward button, a reverse button and a stop button. There are also five operating stations each consisting of three buttons, one for slow speed, one for intermediate speed and one for high speed. When starting up, the operator selects the direction of travel by pressing either the forward or reverse button. Operation of this button closes one of the directional relays but does not start the motor.

When ready to start, the operator presses one of the speed buttons, depending upon which speed he wishes to select, and the motor then starts and accelerates properly to that speed and no further. If he selects the slow speed, only the directional contactor closes, connecting the motor to the line with all of the secondary resistance in circuit. If he chooses the intermediate speed the directional contactor and one of the secondary contactors close and the motor is connected through a smaller amount of secondary resistance. The high-speed button closes the directional contactor and both of the secondary contactors, connecting the motor to the line with a minimum amount of secondary resistance in circuit. The amount of permanent resistance left in circuit at high speed is quite small and is used only to provide a slight cushioning effect when the motor is started or when load is suddenly thrown on it.

Obtaining Speed Acceleration

Automatic acceleration of the motor is accomplished by the use of timing relays mechanically fastened to the magnetic contactors. One of these relays is used in connection with the forward switch and one with the re-

versing switch; the closure of either one will make a circuit for the first resistance contactor. A third timing relay, used in connection with this first resistance contactor, controls the circuit for the second resistance contactor.

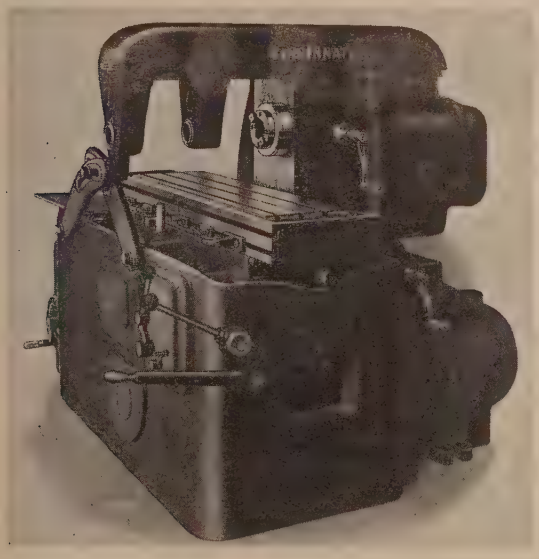
It will be noted that it is unnecessary to reach a high speed by first pressing the low speed and intermediate speed buttons. It is only necessary to press the push button for the speed selected and the motor automatically will accelerate to that point. The five speed selecting push buttons are located at different points around the machine and operation may be secured from any one of them.

Pressure of the stop button will shut down the entire equipment at any time, as will also operation of the overload relay. If a failure in voltage should occur, the equipment will shut down and will not automatically restart. It is necessary for the operator to restart by pressing the push button after a power failure. This control equipment, which was made by Cutler-Hammer, Inc., Milwaukee, was installed by Abell-Howe Co., Chicago, on a specially designed Northern Engineering Works crane.

Builds Smaller Hydraulic-Feed Miller

Machine with 24-in. Table Travel Available in Plain and Duplex Types for High-Production Work

TO the line of Hydromatic milling machines with locked hydraulic feed built by the Cincinnati Milling Machine Co., Cincinnati, has been added a smaller machine designated as the 3-24, with 24-in. table travel. The machine is made in plain and duplex types. Unit plan of construction is followed, the principal units of the plain machine being the standard No. 3 bed, No. 3 headstock, No. 3 spindle carrier with overarm and two arbor supports, spindle reverse and clutch units, and the hydraulic feed unit. The machines can be supplied with widened and raised headstocks, close-coupled spindle carriers, variable height overhung rail, and bridge-type fixed rail, to meet requirements.



THE Hydraulic Feed Unit Is the Same as That Used on the Larger Hydromatics. Any feed from 0 to 40 in. per min. is obtainable; quick traverse is at the rate of 300 in. per min. Plain machines are supplied with either one-way or two-way feed cycles

The bed is of semi-steel, is heavily ribbed and has pockets that permit coolant and chips to flow directly inside of the bed. Splash guards serve to confine the coolant within the table area. The spindle carrier unit and the spindle reverse and clutch unit comprise the entire spindle drive. A multiple disk friction clutch and bevel gear reverse mechanism are contained in the spindle reverse unit. The spindle carrier is self-contained, the entire gear transmission, including the spindle speed change gears, being mounted within it. Standard spindle speeds, eight in number, range from 27 to 200 r.p.m., but high and low series change gears can be supplied. The spindle is carried in a heat-treated 7-in. diameter steel quill that has a cross adjustment of 4¼ in., made through a self-locking worm and rack operated by a crank. Other adjustments for setting up the machine are made from the one position at the right of the machine.

The rectangular overarm, mounted on top of the spindle carrier, is of the company's standard design, but new overarm braces are employed. The spindle is mounted on double anti-friction bearings both front and rear, and all gears are of alloy steel and heat-treated. The face gear is 11 in. in diameter by 1¾ in. face. The entire spindle drive mechanism is equipped with anti friction bearings and is lubricated automatically. There are only four gear contacts from cutter to pulley.

The locked hydraulic feed unit, consisting of a variable displacement metering pump, a small booster pump, a gear pump and control valves, forms the closing member of the rear end of the machine bed. This unit is the same as that of the larger Hydromatics described in THE IRON AGE of Dec. 1, 1927. Hand feed changes are made by means of the lever on the feed unit, any feed from 0 to 40 in. per min. being obtainable. Automatic variable feed to suit a varying width or depth of cut is obtainable through a variable-feed attachment, which can be furnished. A positive stop and delayed trip attachment for feeding to a definite depth and dwelling to clean up the cut can also be supplied.

Operating levers are located conveniently at the operating position. The lower lever is used for starting and stopping the spindle. The lever just above it is the table feed directional control lever and has four positions. On the one-way cycle machine, which has feed to the left and quick traverse left and right, there is one position for feed, two for power rapid traverse of 300 in. per min. and a "stop" position. Two-way cycle machines have two positions for feed and two for power rapid traverse. Plain machines are supplied with either one-way or two-way feed cycles, while the duplex machines are offered only with the one-way cycle. A third lever, located at the side of the bed, starts and stops the table without affecting the table cycle.

Automatic control of all table movements, including automatic intermittent feeds, is obtained by dogs. The arrangement includes new type reversing dogs, set on the side of the table, which operate a trip plunger with oscillatory and reciprocating movement that controls the hydraulic feed mechanism. Reversal time of the milling cycle has been considerably reduced, permitting the use of shorter feeding strokes and giving faster production. A large variety of milling cycles can be obtained.

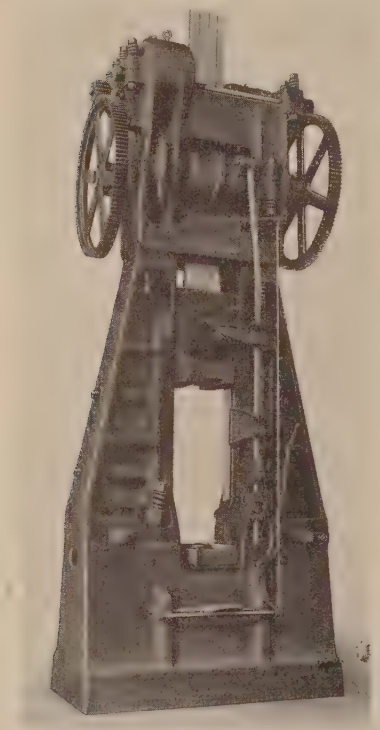
The table of the 3-24 machine has a working surface of 12 x 49 in. The net weight of the plain machine is 5500 lb., and of the duplex, 6500 lb. Machines of the same design but with 30-in. table travel can also be furnished; they are designated as the 3-30 plain or duplex Hydromatic.

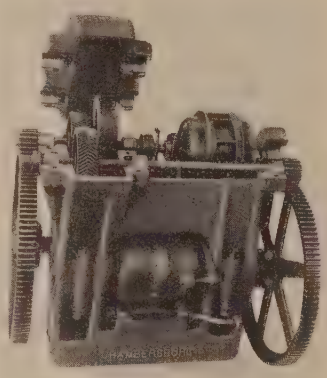
An attractive wall chart giving decimal equivalents of wire, letter and fractional size drills; tap drill sizes, and information relating to grinding, feeds and speeds and lubricants has been issued by the National Twist Drill Co., Detroit. The chart is on stiff board, is made in three folds for convenience and has a varnish finish. It is 11 in. wide and 27 in. long.

Board Drop Hammer with Motor-Driven Head

THE new model H board drop hammer built by the Chambersburg Engineering Co., Chambersburg, Pa., is now available equipped with individual motor drive. The motor-driven head is identical with the belt-driven head of model H machine, which was described at length in THE IRON AGE of Jan. 17, but the motor and driving assembly are mounted on a bracket that replaces the caps over the eccentric bearings. There is but one motor, which is spring mounted and shielded from the heat of forging. The drive to the roll shafts is claimed to provide uniform front and rear roll speed, and eliminate grinding of the boards.

The motor drives the rear roll-shaft through a metal flexible coupling. This shaft drives the front roll drive-shaft by means of a pair of balanced, forged herringbone gears that run in oil. A balanced flywheel on the rear shaft serves to protect the motor from variations of load and is capable of operating the hammer for several blows without power. At the opposing ends of the front and rear drive-shafts are non-metallic pinions that mesh with the cut steel gears on the roll-shafts. Movement of the roll-shafts is allowed for by sufficiently large centers between the drive and roll-shafts. All shafts are mounted in Hyatt heavy-duty roller bearings.





THE Driving Motor Is Spring Mounted and Is Shielded from the Heat of Forging. From the motor the drive is through flexible coupling to the rear roll-shaft, then to the front roll-shaft through herringbone gears. A flywheel is provided between the gears and the coupling of the rear roll-shaft

Among other advantages, the individual motor drive permits location to secure continuous flow of material to and from the hammer as well as greater convenience for reheats. Power is used only when forging and hazards are reduced because the hammer is stopped while it is being serviced. There is no hazard from belts, no need for staybraces and less wear on joints.

New Flexible Belt Lacing

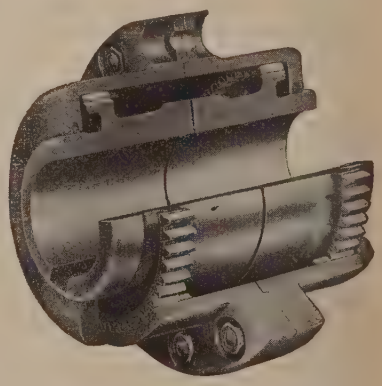
FLEXIBLE belt lacing called Steelgrip, for belts from 3/16 to ½ in. in thickness and for any belt width, has been placed on the market by Armstrong-Bray & Co., 28 North Clinton Street, Chicago.

This lacing is made of a heat-treated steel which has unusual toughness and high tensile strength but which is hard enough so that the points of the lacing will go through the toughest belting and stand up under long continuous use. The joint of the lacing is made with a steel rocker pin composed of two segments, one of which rocks against the other and thereby absorbing the wear at the joint when going over the pulley. The lacing can be applied with a hammer to fabric, leather or composition belting. Being smooth on both sides and flexible, the lacing is adapted for use on idler drives; because of its strength and flexibility it is recommended for use on conveyor belts.

Improved Poole All Metal Flexible Coupling

RECENT improvements in the flexible couplings made by the Poole Engineering & Machine Co., Baltimore, include a combination dust-proof and centrifugal oiling feature obtained by a new type double-flanged end-plate which contains within its inner lip a deep felt packing for the exclusion of dust and dirt. The outer section is grooved and contains back-drain holes which permit lubrication of the coupling while in motion. All parts are heat-treated to rigid specifications to assure longer life and protection against wear.

Few parts and ease of assembly are features of this coupling, which was described at length in THE IRON AGE of Jan. 14, 1926. The load is carried on crowned gear teeth, formed on the periphery of each shaft hub, which mesh with corresponding teeth on the interior of a floating and connecting sleeve member. The crowned teeth allow the sleeve to rock and assume the neutral position without binding action as the shafts rotate. The gear teeth are the only parts in contact and are continually submerged in oil under centrifugal pressure while running.



Improvements Include Centrifugal Oiling and Exclusion of Dust and Dirt

Scovill Mfg. Co. to Issue Bonds for Expansion

The Scovill Mfg. Co., Waterbury, Conn., manufacturer of screw machine products, has called a meeting of stockholders for Dec. 30 to vote on a proposal of the directors to issue $25,000,000 in 15-year 5½ per cent bonds and $12,875,000 of common stock to be used for the acquiring of other companies. E. O. Gross, president, has declined to make public the complete plans of the company, but it is said that one or more plants in the Central West are to be bought.

European Markets Affected by Holidays

General Apathy, But British Tin Plate Is Strong and Pig Iron Well Sold—Japan, Turkey, Egypt, Luxemburg and Germany Figure in News

(*By Cablegram*)

LONDON, ENGLAND, Dec. 23.

IRON and steel markets are quiet, on account of the approaching holidays, and no revival is expected before the new year. Cleveland furnaces are well placed and few accumulated stocks are anticipated over the holidays, as current unexecuted contracts are still heavy. Hematite furnaces are well sold in both domestic and foreign markets and makers now are reluctant to book first-quarter business except at increased prices.

British steel makers have advanced minimum export prices as follows: Plates, 2s. 6d. (61c.); angles and joists, 5s. ($1.22); asserting that they are unable to carry the burden of increased costs.

Tin plate markets are strong, with considerable inquiry, but business is slowing down, and all Welsh works will be closed this week.

Galvanized sheets are dull and prices have been reduced in an effort to attract buyers. Black sheets generally are idle.

On the Continent of Europe

Continental markets here are quiet and generally confused, after the European Raw Steel Cartel meetings. Most works are quoting the agreed minimum prices, but buyers assert that they still can obtain concessions from works wanting business.

The International Rail Makers' Association made no change in prices at its meeting on Dec. 13.

French October production was 894,000 (metric) tons of pig iron and 846,000 tons of raw steel. There were 157 blast furnaces active at the end of the month.

German pig iron production in November was 1,091,000 tons.

British Steel Market Is Quiet

Possible Government Transportation Control in London May Delay Railroad Buying—Steel Making Costs High

LONDON, ENGLAND, Dec. 6.—Business is beginning to show evidence of the usual decline in activity at the end of the year, although the iron and steel industry has not been genuinely active since early fall. Uncertainty as to the Government's intentions with the coal industry, and the unsettled financial conditions throughout the world have contributed toward making both buyers and sellers extremely cautious. In addition, British sellers are still faced with the serious difficulty of meeting severe competition in overseas markets, which has made them rely more upon their home market.

Production costs have shown a steady advance in the past few months, but in most cases producers have refrained from passing these increases on to the buyer. Cleveland pig iron producers are well engaged for the rest of this year and report practically all shipments going directly into consumption. So far, however, forward contracting has been small and irregular. Large railroad and construction contracts, however, promise some substantial buying of steel-making iron early in the new year.

Purchases for replacement, repairs and expansion of the transportation systems in the London area, such as buses, trams and railroads, may be delayed considerably by the Government's suggestion of a unified control under its supervision.

An example of the increases in costs faced by British producers was recently given by F. J. Rees of the Llanelly Steel Co., president of the Swansea Metal Exchange. At the annual meeting of the exchange, he stated that the Welsh steel makers are paying 50 per cent more for coal than in 1913, about 20 per cent more for pig iron, about 40 per cent more for scrap and 67 to 200 per cent

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.88

British Prices f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3	12½s.	to	£3	13½s.	$17.69	to	$17.93

Wire nails, base	0	6¼				$1.55 per keg		
Wire nails, assortments 1 to 6-in. keg	10	6½				2.69		

*Open-hearth steel, 8s. ($1.94) per ton extra.

more for other commodities. Handling charges at the docks on imported ore, he said, had increased by 130 to 143 per cent, on pig iron by 110 to 128 per cent and on scrap by 111 to 166 per cent. The average increases in freight rates since 1913 have been about 73 per cent on coal, 69 per cent on pig iron, 40 per cent on scrap and 73 per cent on steel bars. Wage costs on bars have increased 25 to 61 per cent between 1913 and 1929 and the cost of social insurance is at least 300 per cent above the 1913 level.

Cooperative Buying by Wire Rope Makers

HAMBURG, GERMANY, Dec. 9.—A cooperative buying organization of small manufacturers of strand wire and wire rope, the Einkaufs und Interessen G.m.b.H., Essen, has been sufficiently successful to justify its renewal for two years more. The Einkaufs und Interessen acts as buyer of raw materials for about 50 small plants in Germany and, with substantial tonnages to place, is able to obtain lower prices than an individual consumer. Tool makers and manufacturers of bolts and rivets are planning similar cooperative buying organizations.

Japan Expects Decline in Black Sheet Prices

YOKOHAMA, JAPAN, Nov. 27.—Following completion of its No. 2 sheet mill, the Seitetsu-jo at Yawata expects to produce about 5000 tons of electrical sheets next year. Black sheet production in Japan has been delayed somewhat, so that deliveries by the Kawasaki Dockyard Co. are expected to come into the market in volume about next April. Meanwhile, about 10,000 tons of light-gage black sheets are reported to have been bought abroad by trading companies for delivery at about the same time. Recently the Tokio Galvanized Sheet Co. has been quoting lower prices on its brand, and a still lower market is expected in some quarters as spring approaches.

Lower Prices on Wire Rods in Far East

HAMBURG, GERMANY, Dec. 9.—Following a considerable period of stable prices on wire rods for the Far East, keen competition among European makers has brought about a reduction, despite the fact that makers are united in a cartel. Recent quotations, c.i.f. Kobe or Yokohama, have been £7 9s. to £7 11s. per ton, (1.62c. to 1.64c. per lb.), although the official cartel price is £7 13s. 6d. to £7 15s. 6d. per ton (1.67c. to 1.69c. per lb.). Since reports from the Far East indicate that competition from the United States is less marked than earlier in the year, the lower price level is attributable only to European competition.

Second New Furnace Blown in at Arbed Works

HAMBURG, GERMANY, Dec. 9.—The second new blast furnace at the plant of the Acieres Reunies de Burbach-Eich-Dudelange in Luxemburg has been blown in, and a third furnace will be completed and ready for blast in January. The three new furnaces will replace six old ones, which are to be dismantled. The annual capacity of the three new furnaces will exceed that of the six old stacks by about 100,000 metric tons a year.

New Copper Plant Being Built in Germany

HAMBURG, GERMANY, Dec. 9.—The Siemens-Halske A. G. has begun construction of an electrolytic copper plant near here for the Zinnhütte Wilhelmsburg A. G. The new plant will have an annual capacity of 18,000 to 19,000 tons, which should further reduce importation of copper. In the first 10 months of this year 170,650 tons of copper was imported, compared with 197,801 tons in 1928. At the same time exports of copper increased from 16,477 tons in 1928 to 24,920 tons in first ten months of this year.

Chrome Ore Concessions Sought in Turkey

HAMBURG, GERMANY, Dec. 9.—Concessions to operate in the Turkish chrome ore fields are being sought by European companies, including the British Chrome Ore Co., Ltd., and the Société des Forges Françaises. Thus far a Swedish group, the Baschtasch Turk Maaden Shirketi of Angora, Turkey, is the only interest to be given a concession. This company will be permitted to export 16,000 tons of chrome ore annually.

Steel Cartel Retains Curb on Output

WASHINGTON, Dec. 24.—At the meeting of the administrative committee of the International Steel Cartel, held in Düsseldorf, Dec. 14, it was decided to continue to regulate production to market requirements as a part of the agreement to be concluded in the establishment of sales cartels, according to a cablegram from Berlin to the Department of Commerce.

It was also decided to establish an office for distribution of export orders for the principal products of the cartel membership as a preliminary to the formation of the much discussed sales cartels. It is planned to have the office function for six months, beginning Jan. 1, 1930, during which period an extended study will be made of existing international sales cartels, so that necessary changes may be made before establishing sales groups.

The present production quota, will remain in effect for the first quarter, the actual output being on the basis of 29,058,000 metric tons, or 10 per cent less than the 32,287,000-ton quota in effect prior to the reduction ordered in November. The next meeting of the cartel will be in Paris, March 13.

Wide Range of Bids for Egyptian Rails

HAMBURG, GERMANY, Dec. 9.—Despite the control over rail prices for export that the International Rail Makers' Association is supposed to exercise, a recent opening of bids on 20,000 tons of rails for the Egyptian State Railways brought out a wide variation in prices. Bids were submitted by 10 sellers, including the American Steel Export Co. The contract was placed with David Colville & Sons, Glasgow, Scotland, who received 15,000 tons, and with the Vereinigte Stahlwerke A. G., Düsseldorf, Germany, which was given 5000 tons. The German mill quoted a 2½ per cent lower price than the British maker.

Germany Seeks More Steel Furniture Business

HAMBURG, GERMANY, Dec. 9.—Manufacturers of steel furniture have established a cartel with offices in Berlin and are planning an advertising campaign in Germany to increase the use of their products. A number of manufacturers recently returned from the United States where they studied methods of making steel furniture.

International Wood Screw Cartel Planned

HAMBURG, GERMANY, Dec. 9.—At a recent meeting of British and Continental wood screw manufacturers in Paris, at which American makers were represented, establishment of an international wood screw cartel was discussed. This was the fourth meeting in two years called for such a purpose, but agreement could not be reached. However, a special committee was appointed, which will endeavor to work out a plan upon which all makers can agree.

Reed & Prince Mfg. Co., Worcester, Mass., manufacturer of screw products, has bought the property at 3635 Iron Street, Chicago, with the purpose of increasing its warehouse facilities in that city. The purchase includes a building with about 25,000 sq. ft. of floor space and a tract of land to provide for any further expansion that may be demanded. The Chicago project entails no plans for establishing manufacturing facilities in the Middle West.

This Issue in Brief

Seam welder "stitches" steel plates together to make new battledeck floor. Will strengthen building, lessen dead load, and cut cost.—Page 1721.

* * *

Operating costs in every department are usually reduced when mechanical-handling equipment is installed. Lower handling costs is not the only saving. Benefits are far-reaching.—Page 1721.

* * *

Aluminum alloy sand castings with close tolerances produced with 95 per cent aluminum and 5 per cent silicon. Casts readily and produces sound castings, free from checks and other molding troubles.—Page 1722.

* * *

Uniform hardening is achieved by using two thermocouples, one in the bath and the other within the furnace chamber, each operating a control pyrometer. Excessive temperature changes are prevented.—Page 1726.

* * *

Mass production methods not yet economical in aircraft engine building, but economical arrangement of departments in Wright plant permits adoption of quantity output measures when expansion warrants.—Page 1730.

* * *

Greater speed and accuracy in punching holes in motor bus frames is obtained by use of templets. Templet is clamped to the blank and the holes are punched on a press equipped with a 4-gag punchholder.—Page 1734.

* * *

Turning down of flange on overhead carrying rail is due to peening action. It can be corrected by providing separate wearing surfaces or by using a type of rail which is not distorted by peening. —Page 1734.

Heat-treating costs cut 19 per cent by using electric heat in place of natural gas. Savings in labor, depreciation and repairs offset the considerably lower cost of the gas fuel.—Page 1728.

* * *

Increases output 25 per cent and cuts labor cost by installing push-button control on riveting crane. In steel plate fabricating shop there are three separate control stations, one at control point of each bull riveter.—Page 1740.

* * *

Alloy steel output in 1928 was close to 3,000,000 tons, survey of American industry reveals. Prospects for increased production are excellent.—Page 1736.

* * *

Insulation makes sharp cut in repair bills. Open-hearth acid furnace has run 550 heats with no repairs on roof ends, front and back walls or checker chamber.—Page 1737.

* * *

During hardening operation, shovels are kept down in lead bath by covering it with two-inch layer of powdered coke.—Page 1732.

* * *

Higher graphite tariff unfair and uncalled for, say graphite products manufacturers. Domestic product is already cheaper than imported, and is not used because of inferior quality.—Page 1739.

* * *

Radio testers take their place in assembly line. Traveling belt carries completed sets to testers in sheet steel booths. A signal is made especially for the test.—Page 1720.

Spend money on machining your foundry equipment and you will save money when machining the castings in the machine shop. Government foundry finds it pays to use foundry equipment designed for maximum accuracy.—Page 1722.

* * *

Pattern accuracy is obtained by making saw cuts in thin sections to allow expansion and contraction of members of pattern assembly without affecting the controlling dimensions.—Page 1722.

* * *

Die expense prevented steel auto-bus bodies from competing with wood when only a small number of bodies of a certain design were wanted. But now that the industry is standardizing, multiple production is possible, and all-metal bodies are being made. —Page 1732.

* * *

Radio manufacturer uses a zinc-copper-aluminum alloy for his die castings. Single gas burner melts cold charge in 30 min.—Page 1718.

* * *

Distortion in castings reduced by allowing sufficient time for cooling before shaking out. Heads and gates of aluminum castings are removed by sawing, which is also a distortion preventative.—Page 1724.

* * *

Proper tempering of sand is important in making high-quality aluminum alloy castings. Best results are obtained when sand is worked as dry as practicable, with moisture content never above 6 per cent.—Page 1723.

ESTABLISHED 1855

Calls on the Trade Association

THAT trade associations have won a large place in the scheme of things recent events have proved. When the move was made to mobilize industry and commerce after the first business-alleviating conferences were called by the President, heads of trade associations were selected to form the nucleus of the stabilizing machine.

The big figures of business, in their statements of conditions and prospects, served to remove suspicion that things were really worse than surmised. Now it is desirable to get accurately the succeeding pictures of changes when, and if, they occur. A wide subdivision of industry was wisely regarded as necessary, and the committee of 140 now appointed as the business survey committee is made up almost wholly of the leaders of what may be classed as trade associations.

Each representative is admittedly close to the outlook of his specialty. Through his association he can work to promote a repair, re-equipment and general betterment campaign while financial readjustments are under way and the broad construction programs promised are getting into full swing. For his own group he will probably be expected to report (to the executive committee of 20 in the Washington stabilizing setup) perhaps monthly for a time, respecting new facts bearing on significant changes and trends.

Thus we see a recognition of the trade group as a fact-finding agency and as a working unit for supplying information for industry as a whole. The responsibility is large, for it will not do to color unduly a given situation and again give rise to unwarranted doubts. For the present it does not seem to be the plan that this stabilizing machinery shall operate indefinitely. It may prove too cumbersome, for one thing. Yet how useful it would be if it could attempt to control the business cycle on the uptrend as well as now on the downtrend. To try to check an upswing would clearly be very difficult as well as unpopular, but it is the unbridled expansion that is followed by the depression.

If the lessons of the succeeding weeks prove that cooperative action among trade associations brings concrete results, there may be a demand for a coordinating bureau, say in the Department of Commerce, so that industry may supplement the statistics, which an association makes it a major activity to collect, with dependable information of the human factors that so often overturn the statistical.

The rule of reason respecting applications of the Sherman Law, the depression of 1921 that brought a demand for more economic facts than were hitherto available, and the group attempts of business to raise its ethical status through the trade practice conferences of the Federal Trade Commission have helped the growth of the trade association immeasurably. The new business stability obligation of the association should also help kindle the association idea where it now lies dead or dormant.

Structural Steel Index Favorable

STATISTICS of the structural steel fabricating shops make an interesting and favorable showing. In steel trade thought these statistics are hardly accorded as large a place as their importance deserves. They represent no inconsiderable part of the total steel made, they are associated with financial conditions, and they are particularly prophetic in several respects.

In the first place, the bookings of the fabricating shops represent steel that is still to be made. In the second place there is work to be done and labor employment to be furnished, after the steel has been fabricated and delivered, while in the case of apartment dwellings, hotels and office buildings the work extends for many months after erection of the steel. Finally, the structures commonly represent long-term investments, entered into with particular care. When there is much construction it is evident that investors take a favorable view of the long-range future.

It is a curious thing that, just as the tightening of money rates a year and half ago began to attract general attention, lettings of fabricated structural steel jobs underwent a sharp increase, and the higher rate was maintained thereafter with scarcely any interruption. The change occurred with May, 1928. Lettings in the four months preceding averaged 241,000 tons a month, while for five months thereafter they ranged well above 300,000 tons. Then, after a partial reversion to the old rate for five months, they made an all-time high record of 358,050 tons last March, and they have been heavy ever since with the exception of last month.

The statistics may be checked in an interesting way against the appearance steel in general presented, of beginning to lose its special activity at just about July 1 of this year. Lettings in the four months after that date were just a trifle above those in the four months preceding—1,386,000 tons against 1,382,150 tons.

This year as a whole is making a record showing by a substantial margin. Only the November lettings were light, and reports thus far this month suggest

that December will do better, but assuming December as merely equal to November, the year's bookings and shipments, of all fabricating shops as indicated by Department of Commerce reports, make the following comparison:

Fabricated Structural Steel—Net Tons

	Bookings	Shipments
1924	2,640,600	2,669,940
1925	2,980,730	2,998,080
1926	2,894,400	3,214,800
1927	3,052,500	2,853,750
1928	3,287,900	3,126,200
1929*	3,761,450	3,603,600

*December estimated equal to November.

Here is a gain in bookings of more than 14 per cent over 1928, previously the record year, and a gain of 26 per cent over 1925, record in its time.

A comparison of bookings and shipments indicates the relative state of order books. In 1924 and 1925 there was an even break between bookings and shipments, while in 1926 the order book lost. Both last year and this the order book has gained. There is more business on books than one year ago and still more than two years ago, making a very favorable showing for one class of building activity for the opening of the year 1930. Allowing for steel involved in this construction work, but not represented as fabricated structural, in the neighborhood of 10 per cent of the total steel produced in the last few years is accounted for by this activity.

Less Coal and More Power

IN a year of unusual industrial activity, requiring much power, the production of coal is less than in five preceding years, one of them 12 years earlier. This year's coal production may be forecast at an even 600,000,000 tons, made up of about 524,000,000 tons of bituminous and 76,000,000 tons of anthracite. In two war years production was 650,000,000 to 675,000,000 tons, though it must be admitted there were large stocks left. Then in 1920, 1923 and 1926 there was over 650,000,000 tons.

Measured by volume of output our industrial growth has been fairly large since 1913, though not so large in ratio as previously, but as to power requirements that is not all. In nearly every line we use more and more power per unit of output.

If we obtained all our power from coal, and with the same amount of efficiency—or rather inefficiency—as in the old days there would have been a very large increase in coal requirements since 1913. Two things occurred: a much stronger trend toward the economical use of coal and large increases in production of petroleum and natural gas.

The turn that occurred in the production of coal is depicted simply and forcibly by noting periods of time it required for production to double. Starting with 1880, when production of bituminous and anthracite was 71,481,570 net tons, there were doublings approximately as follows: in eight years to 1888, in 13 years to 1901 and in 12 years to 1913, when production was almost precisely eight times that of 1880, or an average of a doubling in 11 years. From 1913 to 1929, 16 years, there is only about 5 per cent increase.

We can conjecture roughly how much coal has been displaced, so to speak, by increased production of petroleum and natural gas. From 1913 to 1929 the increase in petroleum is roundly about 750,000,000 barrels, with an increase of somewhat over 1200 billion cu. ft. of gas. On a strictly heat-unit basis these increases represent about 170,000,000 tons of bituminous coal in the case of petroleum and about 50,000,000 tons in the case of gas. Not all of the oil and gas is used as substitute for coal, by any means, as witness the automobile in particular, but when so used there is generally more efficiency. We shall be conservatively high if we add the quantities of coal mentioned to this year's actual production, whereupon we find only 44 per cent as the supposititious increase in coal requirements from 1913 to 1929, and a 44 per cent increase in 16 years is quite different from a doubling in 11 years.

We have some indexes as to the pace at which economy in coal production has been proceeding. In nine years covered by actual statistics, 1919 to 1928, the public utilities decreased their coal consumption per unit of current generated by 45 per cent. Also there are data showing that per unit of freight train weight moved the railroads decreased coal consumption about 27 per cent in eight years from 1920 to 1928.

Some coal consumers have progressed more than others, and the others will make progress in future. We are by no means done in introducing economical methods of using coal.

Incidentally one readily sees one great reason why the coal industry has been in such poor shape in recent years, with a large excess of capacity. The previous history of rapid growth fixed the idea that more and more coal mines would be needed. Opening of coal mines had momentum which it took time to dissipate.

Research in a Large and Small Way

OF all the things which visiting industrialists from Europe dwell upon, the ones most often commended are our great organizations for mass production and the integrated business corporations controlling all steps in the manufacture, distribution and sale of their commodities. Our foreign friends, while admiring these activities in the States, almost invariably hasten to assure their countrymen that these conditions are indigenous to the Western continent, and cannot be transplanted to the older civilizations of Europe, where the business structure, the living conditions and the mental habits are so different, saying, "In America, Americans can do things on a grand scale. In England, the English are more individualistic."

This habit we have, over here, of doing things so grandly is not without its disadvantages in certain endeavors—such as fundamental or scientific research, for example. Two cases in point may be cited. A research into the alloys of iron, planned and sponsored by the Engineering Foundation, is waiting until $150,000 is subscribed before it can move in a large way, for its work so far has been ordered to conserve the

principal sum. American Institute of Mining and Metallurgical Engineers also has in its Seeley W. Mudd Memorial Fund a total of $200,000, but is endeavoring to multiply it by five in order "to take up a portion at least of the problems now untouched."

Both of these incompleted funds are worthy of the most generous support from the iron and steel industry, and THE IRON AGE is confident that the leading executives in the country have a proper appreciation of the importance of research. However, it is questionable whether such large sums are necessary before a useful start can be made.

Examples of important work steadily carried on with modest finances may be found on both sides of the Atlantic. In England, the Iron and Steel Institute has been able to finance the work of a long line of Carnegie research scholars on the income from a £25,000 endowment, and the younger and smaller Institute of Metals has for several years been financing, by subscription, fundamental work on the corrosion of brass and bronze.

A noteworthy amount of engineering research is also being conducted by various American societies, financed by subscription and volunteer effort. The investigations by the American Welding Society into structural welding, by the American Society for Testing Materials into corrosion, and into the properties of die castings, by the American Society of Mechanical Engineers into heavy-duty bearings and springs—to mention only a few—indicate that we also know how to get things done by a temporary organization.

All these things are part and parcel of that essential advance in knowledge that President Hoover, some years ago, estimated would cost industry several millions of dollars. American industry cannot afford not to support research generously, for it will lose far more from ignorance than the knowledge gained would cost. To anticipate that manufacturing industry in the United States will not provide funds for future research is to ignore the existence of Dr. Whitney, Dr. Jewett and Dr. Becket. Industrial research laboratories such as theirs number several hundred and the annual maintenance totals many millions.

Furthermore, we are getting ready to do more on these same lines. The United States Steel Corporation has established its central research laboratory; the Batelle Memorial Institute has opened its doors; and the newest steel merger has taken pains to announce that one of its important subsidiaries will be the Republic Research Co.

It sums up to this—a generous amount of provision has already been made for industrial research. A notable amount of cooperative research work is now under way. We have rather more laboratory facilities both in universities and in quasi-public institutions than we have adequate investigators.

Research will go on; it *must* go on; but it will be unfortunate if the development of organization must be hampered long because money facilities are so slow in accumulating.

CORRESPONDENCE

First Steel Coal Breaker

To the Editor: The comment of J. H. Pennington in your issue of Dec. 12, is of unusual interest. When the writer made the statement relative to steel breaker construction in the anthracite field, he was fully informed about the Drifton breaker, but concluded it should not be classed as a steel structure.

The paper presented by Eckley B. Coxe, and referred to by Mr. Pennington, sets forth clearly why this breaker built late in 1889 and early in 1890 cannot be considered as other than an iron structure. Mr. Coxe's paper describes it as follows: "The iron breaker is a pin-connected structure, the posts being of cast iron, the struts generally of cast iron, and the tie rods of wrought iron. Most of the larger beams are riveted plate girders. The smaller are rolled iron."

Structural steel was comparatively a new and untried commodity in 1889, and it is only reasonable to assume that if any steel had been used, Mr. Coxe would have so stated. The paper read before the institute of mining engineers includes a "Bill of material of the more important iron members of the breaker structure." The rolled sections are listed under this caption of "iron members" and no mention of steel is made.

The paper states: "The trussed and riveted girders, the rolled beams and tie rods were made by the Pencoyd Iron Works." Pencoyd continued to roll iron up until 1895, and no doubt the greater portion of its production in 1889 and 1890 was iron. The Phoenix Iron Co. rolled iron almost exclusively until 1893.

The Betz Building in Philadelphia now being dismantled was built in 1893. The "iron work" was furnished by the Phoenix Iron Co., and the dismantling reveals the fact that more than one-half the members were of rolled iron. The columns were steel, but the floor beams, etc., were iron.

The Buck Mountain breaker of the Lehigh Valley Coal Co., built about 1908, is the first steel-frame breaker to prove satisfactory. The structure was designed, fabricated and erected by engineers who gave proper attention to wind bracing to take care of vibration caused by the breaker machinery. This overcame the principal objection to steel-frame breakers; and together with the advent of the H-column, had much to do with the adoption of steel construction for permanent work about the anthracite mines.

FRANK W. JONES,
Philadelphia. Eastern Steel Co.

High-Chromium Steels Best for Roasting Furnace Rabbles

Chromium-iron alloys, low in carbon, are reported to be most suitable for roasting furnace rabbles used for zinc sulphides. In these furnaces, a thin bed of hot ore is rabbled from hearth to hearth by mechanical means. Temperatures reach 1100 deg. C. and atmospheres contain up to 6 per cent SO_2; however, corrosion of these alloys is confined almost exclusively to the "wash line," i.e., at the surface of the bed of fine ore.

Experiments at Port Pirie, South Australia, quoted in *Engineering and Mining Journal*, Nov. 30, indicate that the best alloys contain about 27 per cent chromium, silicon 0.75 per cent, carbon 1.5 per cent or less, and balance iron. Various high chromium-nickel alloys were tried, but the presence of nickel greatly reduced the corrosion resistance under the conditions existing in the furnace.

Western Pipe & Steel Co. Acquires Chicago Company

The Western Pipe & Steel Co. of Illinois has been acquired by the Western Pipe & Steel Co. of California, according to an announcement by officials of the latter corporation. The Illinois company started operations about six years ago and has developed a special line of pressed steel specialties for railroads. One of these specialties is a steel bulkhead for use in refrigerator cars. The company recently acquired 25 acres at Blue Island, Ill., and has completed a modern manufacturing plant. The Western Pipe & Steel Co. of California now operates plants at San Francisco, Los Angeles and Fresno, Cal., and at Phoenix, Ariz.

Wheeling Steel Buys Tyler Tube & Pipe

The Wheeling Steel Corporation, Wheeling, W. Va., has acquired the Tyler Tube & Pipe Co., Washington, Pa., manufacturer of lap-welded boiler tubing and light weight pipe. The company was organized in 1890 and for a long time was prominently identified with the making of charcoal iron tubing. In recent years its principal product has been steel tubing. The executive personnel of the Tyler company will probably be represented on the Wheeling board.

River Movement of Steel Declined in November

Movement of iron and steel products on the Ohio River in the Pittsburgh district during November totaled 88,011 net tons, as compared with 119,129 tons in October, and 137,019 tons in November, 1928, according to the United States Engineer Office, Pittsburgh. Traffic on the Monongahela River totaled 83,189 tons in November, as compared with 119,380 tons the preceding month, and 143,238 in November of last year. On the Allegheny River, 500 tons of steel products was moved in November, compared with 800 tons in the same month last year.

New Machinery Company Formed at Hartford

A group of prominent manufacturers of Hartford, Conn., and Springfield, Mass., have joined in the formation of the Hartford Engineering & Mfg. Co., which will design and build special machinery, in addition to taking over the manufacture of the Whitney hand milling machine, which for many years was built by the Whitney Mfg. Co. of Hartford, and during the past two years by the Young Mfg. Co., same city.

The Hartford Engineering & Mfg. Co. is capitalized at $100,000. Offices and shops will be located in the building of the Automatic Refrigeration Co. at Laurel Street and Capitol Avenue, Hartford.

John Oakley, vice-president, Perkins Machine & Gear Co., West Springfield, Mass., becomes president of the new company; Frank L. Young, head of the Young Mfg. Co., is vice-president and general manager; Earl C. Abbe, vice-president of the Moore Drop Forging Co., is also a vice-president, and the secretary and treasurer is Earl W. Knight, an engineer of Springfield. Others who are interested in the company are: Clayton R. Burt, vice-president and general manager, Pratt & Whitney Co., Hartford; Clarence E. Whitney, president, Whitney Mfg. Co., Hartford; Arthur B. Reynders, works manager, and William H. Scherer, superintendent, Westinghouse Electric & Mfg. Co., Springfield; Dr. Edward C. Gilbert, general manager, John J. Duggan, treasurer, and Thomas F. Mahar, sales manager, of the Chapman Valve Co., Indian Orchard, Mass; Julian N. Perkins, president, Perkins Machine & Gear Co.; William H. Hill, production manager, Curtiss-Wright Airplane Corporation, Paterson, N. J.

The Week in Business

Drift of Current Financial and Economic Opinion

FORECASTS for 1930 are beginning to accumulate. One of the earliest, that of Col. Leonard P. Ayres, of the Cleveland Trust Co., holds that general business next year "will be slower, but not slow, poorer but not poor." Output of iron and steel, he says, will be "distinctly less," the value of building construction "will probably not differ from that of 1929 by more than 5 per cent," and production of motor cars and trucks will fall off between 500,000 and 1,000,000 units — the last incidentally a latitudinous estimate, as it ranges between 9 and 18 per cent.

He expects price of non-agricultural commodities to average below 1929 by less than 5 per cent, industrial wage rates by 3 per cent or less, building costs only slightly under and net profits of industrial companies distinctly so. The year will "start poorly and finish well."

Year-End Consumer Buying

Current holiday retail sales are being watched for the information they may offer in respect to consumer buying power. Preliminary reports are conflicting, so that it is yet impossible to test the contention that a good volume of Christmas trade was certain in spite of the stock market crash, because employment and payrolls have run at a high level since the beginning of the year. Apparently the effect now expected is less expansion in year-end consumer purchasing than would otherwise have been looked for and some contraction possibly later on in 1930.

Another step in the Hoover-planned business-stability program has been taken in the appointment of the Business Survey Conference Committee of 140 by Julius Barnes, chairman of the Washington conference of Dec. 5. The members are to file statements by Dec. 28 covering significant changes and trends not apparent on Dec. 5. Then there will be the decision as to whether or not corrective measures are practicable and necessary. Theodore H. Price, in *Commerce and Finance*, is sure that "a spending campaign has been inaugurated that will provide work for everyone and keep most of our productive facilities fully employed."

Machinery Exports to Japan

Increased exports of machinery are regarded by the Alexander Hamilton Institute as one of the likely happenings following the return of Japan on Jan. 11 to the gold standard for the yen. It is the recent reduction in the Japanese import balance that has worked, among other things, for the removal of the gold embargo.

Use Advertising as in the War

Advertising is offered by several writers as the helpful instrument for bettering the present business situation. And E. E. Calkins, before the Adcraft Club of Detroit, urges a campaign of the scope of those used during the war. He would bring understanding that "it is up to each one of us whether business continues its present satisfying gait or whether it trips up because Wall Street says 'boo'." The Alexander Hamilton Institute expects advertising expenditures in 1930 to exceed 1500 millions of dollars and that magazines will fare rather better in their relative share, as compared with 1929, than the newspapers. The amount of advertising spent in business papers one infers is about $85,000,000 per annum.

Iron and Steel Markets

Improvement Indicated for January

Some Steel Producers Look for a 75 Per Cent First Quarter—Structural Awards 90,000 Tons—Scrap Up 50c. at Pittsburgh

FURTHER increases in specifications from the automobile industry, large awards of fabricated steel, additional strength in scrap and drastic reduction of consumers' stocks are encouraging features of the steel market.

Mill operations have been sharply curtailed, with many units idle for the entire week. Raw steel output will not be cut down proportionately, but the average, counting suspensions, may not be more than 40 per cent of capacity. The rate for December promises to be lower than that for any month, save in the summer of 1924, since the depression of 1921.

The very severity of the fourth quarter decline in production is regarded as the best promise of an early recovery. December's recession in ingot output from November may approximate November's 19 per cent drop from the October rate. The greatest decline in any single previous month was 34 per cent in December, 1907.

The thoroughness with which both manufacturing consumers and warehouses have deflated their steel inventories definitely calls for an improvement in tonnage releases next month. This expectation is borne out by developments at Chicago, where the blocking of shipments by one of the worst blizzards in years was immediately reflected in increased specifications from steel users.

A rush of new business in January is not looked for, since it is realized that many buyers are awaiting further price tests, but betterment is expected in proportion to the damming up of requirements in recent weeks. It is noted that the automobile industry, which has largely passed its inventory period, is continuing to increase its drafts on the mills. First quarter contracts for alloy steel bars have been placed by the largest buyers in the automotive field and fair January bookings from both motor car builders and parts makers have been entered for sheets, strip steel and carbon steel bars. The Ford Motor Co. has made large purchases of automotive accessories and now is understood to be aiming at an output of 125,000 cars next month.

Steel producers are disposed to suspend judgment on the rate of recovery in motor car production until after the January automobile shows, when the reaction of the public can be better appraised. However, steel interests with a diversified trade, and not primarily dependent on business from motor car makers, look for a substantial gain in mill operations, a number of them estimating that their ingot output for the first quarter will average close to 75 per cent.

The confidence of the industry rests partly on a downward revision of production estimates for 1929. It is now clear that total steel ingot output for the year will exceed the previous record, made in 1928, by not much more than 8 per cent. Pig iron production, which felt the stimulus of steel needs more than last year, will exceed the previous high mark, reached in 1923, by 6 per cent.

The strength manifested by the Pittsburgh scrap market in the past three weeks has crystallized in a 50c. advance in heavy melting steel, the first increase in that grade since Aug. 13. Chicago old material prices are also stronger, partly because of severe weather, with advances registered in several grades. At Philadelphia a mill purchase of 10,000 tons of heavy melting was closed at $14.50, the previous ruling price. Heavy melting grade at Cleveland, however, has declined 50c. a ton, although market sentiment has improved with the release of shipments by Youngstown, Warren and Canton mills that were taking virtually no scrap two or three weeks ago.

Billets, slabs and sheet bars have undergone a general decline of $1 a ton to $34, Pittsburgh or Youngstown. The reduction is mainly a "paper" one, since $35 was nominal for some time and ruled on very little contract business. Pressure against finished steel prices is still severe, but concessions are not widespread. In some cases mills have shown a willingness to shade on spot business, for example on black sheets, but have remained firm on contract tonnage. Hot-rolled strips and plain wire have also shown weakness.

Beehive furnace coke has declined 5c. a ton to $2.60, Connellsville, following a shrinkage in demand that has outstripped the curtailment of output.

Structural steel awards, at 90,000 tons, were the second largest for any week this year. This total, coupled with that of 51,000 tons for the previous week, reflects a degree of activity that is unusual for this season. Computed awards for November, at 227,150 tons, showed a sharp drop from the October figure of 350,350 tons, but the total for the 11 months, as reported by the Department of Commerce, was 3,534,300 tons, or nearly 7½ per cent larger than lettings for all of 1928, the previous record year.

Fresh rail orders at Chicago total 20,000 tons, and 100,000 tons additional are expected to be placed by small Western roads soon after the first of the year. Railroad freight cars ordered in 1929 will exceed 100,000, the largest number purchased since 1924.

Lower prices and quantity differentials on low-carbon stainless steel products have been announced by the American Stainless Steel Co.

THE IRON AGE composite prices are unchanged at the year's lowest levels, pig iron at $18.21 a gross ton and finished steel at 2.362c. a lb.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Industry's Forecasts Are for Moderate Recovery in January—Many Idle Mills This Week

PITTSBURGH, Dec. 23.—The holiday week is a period of pronounced inactivity in the Pittsburgh steel trade. Specifications are meager, shipments are light and operations are at a minimum with most mills. Buying is negligible, and companies which had not already closed their first quarter contracts are now inclined to wait until January.

In spite of this, sentiment in the industry continues good, and there are few companies in this district which do not feel that the turn of the year will see a decided change in business conditions. It cannot be denied that consumer inventories are so low that the early weeks of January are certain to see an improvement in tonnage releases. Manufacturers must specify as well as warehouses, because stocks of raw materials at this time are abnormally low. Specifications over the last two months have been only for immediate requirements, and mills have furthered this tendency on the part of buyers by declining to force business.

With the eyes of the industry turned toward future developments, forecasts for the first quarter are receiving considerable attention. There is little doubt that business will show a considerable improvement in January, but whether the trend will continue upward in February and March is a matter to be determined by developments in principal steel consuming lines.

January buying may seem large as compared to that of the last two months, but it may be confined only to limited requirements, and the remaining months of the first quarter may be characterized by the caution which has persisted in November and December. On the other hand, it would not be surprising to the trade if business increased gradually in February and March, with steel requirements reaching normal proportions early in the second quarter.

During the last two weeks, specifications from the automobile industry have shown some improvement, but have lacked substantial volume. This activity is undoubtedly prompted by the automobile shows in January, and a continuance of recent orders in increasing volume will depend entirely upon the public's attitude toward buying, as indicated by the shows. Steel operations in Pittsburgh and nearby districts this week are sharply curtailed, and complete suspensions in many departments are reported. Strip mills, which pushed production last week, are largely inactive, and sheet and tin plate departments will not run more than half the week. Open-hearth operations continue very low, with most of the smaller independents operating less than half their furnaces.

Prices show little change, but recent buying has added no strength to the market. Makers of semi-finished steel are now quoting $34, as compared with the recent $35 figure, and this decrease has not stimulated first quarter contracting. On the heavy hot-rolled products, the 1.90c., Pittsburgh, price is nominal, as few of the larger buyers have closed first quarter contracts at this figure. Sheet prices are weak, although concessions have not been common enough to warrant lower quotations. It now seems evident that first quarter prices will not be established until the first of the year, and

if buyers continue to press for concessions in nearly all lines of products, mills will have considerable difficulty in holding prices at present levels.

Semi-Finished Steel.—Makers of semi-finished steel in Pittsburgh and Youngstown have finally recognized the $34 quotation on billets, slabs and sheet bars, which have been made by a Cleveland mill, and are prepared to take contracts for first quarter at this price. This does not represent any particular weakness in the market, as the $35 price had been nominal for some time, and very little contract business was ever taken at that figure. A few small spot orders have been placed at this price, but by no means a representative part of the tonnage sold. On forging billets, some first quarter business has been taken at $40, but in some cases such contracts may have to be revised downward, as forging billets ordinarily take a $5 premium over the rerolling product. Recognition of the lower price has not stimulated business to any great extent, and users of semi-finished steel in this territory are in no hurry to place their first quarter contracts. Wire rods are unchanged at $40, Pittsburgh or Cleveland, and buyers are slowly placing their usual contract tonnage.

Pig Iron.—Market prospects are brighter, and buyers have clearly indicated in the last week that they are going to need iron in a very short time. The A. M. Byers Co. is said to be sounding out the market for a round tonnage, but is not anxious to place orders at the present quotations. This company will soon begin to buy Bessemer iron for its new Ambridge, Pa., plant, and in the meantime continues to use the foundry grade at Girard, Ohio. The Columbia Radiator Co., McKeesport, Pa., is also thought to be in need of pig iron, although no formal inquiry has been issued. The Westinghouse Electric & Mfg. Co. has not yet closed against its requirements for Trafford City, Pa., and Cleveland. Last week, the Pressed Steel Car Co. bought about 500 tons of foundry iron, which was divided between the Pittsburgh producer and a Valley interest. Shipments are very light. Stocks of iron in consumers' hands are lower than they have been for several years. In view of this, the leading sellers in the district expect considerable buying in the next few days, although some of them feel that users will continue to place small orders for immediate requirements rather than commit themselves over the entire first quarter at present prices. In the meantime, producers are curbing production. The Shenango Furnace Co. will blow out its remaining active stack tomorrow. This will leave only one merchant furnace in operation in the Valleys and but one in the Pittsburgh district, and bring production to a very low point, Small orders in the last week have been taken at $18.50, Valley, for foundry and basic iron, and at $19 for malleable and Bessemer. The local producer continues to quote prices 50c. higher, but Valley makers meet this quotation when coming into the Pittsburgh district.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Bars, Shapes and Plates.—Small users of the heavy hot-rolled products are placing their contract tonnage for the first quarter of 1930, but the larger consumers are somewhat more hesitant. However, the 1.90c., Pittsburgh, price on bars, shapes and plates is holding on the general run of business, and there is every reason to believe that this price will be carried into the first quarter. Operations are holding up fairly well on shapes, but bar mills are running slowly and there is not sufficient tonnage to justify very high schedules in the plate mills. Railroad car builders in this territory will not begin specifying the material required for recent car awards until January, but mills are counting on this tonnage to improve rolling schedules considerably in the early months of the new year. Structural mills are depending largely upon backlog tonnage at this time, but some new work is coming out. An addition to the Duquesne Club in Pittsburgh will require 1300 tons of shapes. A fair-sized barge order may be placed before the end of the year. A few releases on bars are coming from automobile and parts makers, but the volume of business from this source is still comparatively small. Cold-finishing mills are taking very little steel, and other consuming lines are quiet.

Tubular Goods.—The pipe business is in a quiet season, and shipments have gradually declined during the month. Mill operations are under 50 per cent of capacity, and immediate improvement is not in sight. Makers of mechanical and boiler tubing are not finding tonnage as heavy as it was in November, and of course business is considerably behind the same period of last year. Pipe prices are holding very well in this territory.

Wire Products.—Shipments to jobbers are normally rather light during December on account of inventory, and this year is no exception. Occasional orders for carload lots of nails are reaching local mills, and the urgency for shipment indicates the low stocks of the buyers. Shipments of manufacturers' wire to the automotive and allied industries are about equal to those of November and have shown slight improvement with some companies during the last week. The price is holding at 2.40c. Pittsburgh. On wire nails the $2.40 to $2.50, Pittsburgh, quotation is better established than it was, and as business taken at lower prices is cleaned up at the year-end, the market is expected to gain more stability. Annealed fence wire is unchanged at 2.55c. to 2.65c., Pittsburgh.

Stainless Steel Products.—Prices on the low carbon stainless steel products have been reduced and quantity differentials have been set up for large lots, according to an announcement by the American Stainless Steel Co. The reduction reflects the lower quotations on ferrochrome announced a few weeks ago. Under the new classifications, grades of stainless steel containing 0.12 per cent carbon and under are grouped in four ranges, according

8-lb. coating I.C. $10.70	25-lb. coating I.C. $15.90
15-lb. coating I.C. 13.40	30-lb. coating I.C. 16.80
20-lb. coating I.C. 14.60	40-lb. coating I.C. 18.80

Alloy Steel Bars

(F.o.b. makers' mill)
Alloy Quality Bar Base, 2.65c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1½% Nickel)	$0.25
2100	(1½% Nickel)	0.5b
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+46
¼ to ⅜	47	30½	½	23	7
½	58	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3½ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

to their percentage of chrome, namely, 15 per cent and under, 15 to 18 per cent inclusive, 18 to 23 per cent and 23 to 30 per cent. Formerly, chrome percentages were arranged in three groups. On stainless cold-rolled strips, the reduction amounts to 6c. a 100 lb., while the prices of stainless steel sheets are about 5 per cent less. Quantity differentials will amount to ½c. a lb. on lots of 10,000 to 36,000 lb. in single shipment orders of one size, and 1c. a lb. on lots of more than 36,000 lb. The base price, with usual extras, applies to orders of 2000 to 10,000 lb. of bars, billets and tube rounds, and 5000 to 10,000 lb. of sheets, plates and strip.

Sheets.—Sheet mill operations were slightly higher with most companies last week than they were in the first half of the month, but this week will see complete cessation of activities in many plants and production will drop to the lowest point of the year. As specifications have been improving a bit in the last few days, fairly good schedules are expected next week and the improvement will likely be carried into January. The trend of operations after that depends largely upon the automobile industry, which has not yet definitely committed itself on the volume of tonnage it will require in the first quarter. Other consuming lines are taking only small tonnages and in most cases shipments are rush. This leads to costly mill schedule, as some companies are forced to start up mills for very short runs in order to serve customers whom they do not wish to disappoint. Prices are generally unchanged. A large percentage of customers have placed their first quarter contracts at the present quotations, but this percentage does not include many of the large buyers who are still pressing for price concessions. In the last week one or two, mills have expressed their willingness to take business for immediate rolling at concessions in order to fill out operating schedules, but such mills would not take contract business at lower prices. On black sheets, the 2.75c., Pittsburgh, price is holding in most cases, while galvanized sheets are selling at 3.40c. to 3.50c, the higher price applying only on small tonnages. Blue annealed sheet and light plates are still quotable at 2.35c. and 2.20c., Pittsburgh, respectively, so far as jobbing mills are concerned, while companies making this material on wide strip mills are quoting $2 to $4 a ton less.

Tin Plate. — Mill operations last week were rather high, averaging from 60 to 80 per cent of capacity in this and nearby districts, but this week nearly all the tin mills have suspended operations entirely. However, specifications are gradually improving, and schedules will be higher in January.

Strip Steel.—Specifications are somewhat better, although generally for small tonnages on which shipments are deferred until January. Operations were heavier last week, although the industry as a whole is not running at more than 40 per cent of capacity. This week complete suspensions are in effect in a number of mills, but sufficient tonnage releases are expected to accumulate to provide a fair rate of operations the week following. Smaller buyers are under contract for first quarter at the full prices, but larger consumers are still holding off and one or two of them insist that quotations lower than 1.90c. and 2c., Pittsburgh, on hot-rolled strip have been made. On cold-rolled material, a price of 2.65c., Pittsburgh or Cleveland, has been mentioned in connection with a few sales to tubing manufacturers, but the 2.75c. quotation is holding on the general run of orders.

Cold-Finished Steel Bars.—Business shows a slight improvement, but December shipments are going to be very light. The most encouraging thing about the market is the price, which is holding well at 2.20c., Pittsburgh. Specifications from farm implement makers served by this district are in fair volume, but other consuming lines are taking little steel.

Coke.—The furnace coke market is distinctly weaker, and the $2.65, Connellsville, price no longer applies to much business. Production has not declined as rapidly as demand, and many sellers are very anxious to dispose of surplus tonnage. At present no sales at less than $2.60 have been reported, but sales would be made at less, and the market will possibly decline to lower levels. Heating coke is moving considerably better as a result of recent cold weather, but the foundry grade is very dull and shipments have practically ceased for the next week or two. Prices are weak and only nominal in the absence of significant buying.

Old Material.—The scrap market retains its renewed strength, and a recent sale of No. 1 heavy melting steel is said to have been made at $16. At least one or two dealers are willing to pay $15.50 or more for this grade, and, as this was the last price paid by a mill in this district, there is every reason to believe that the scrap market has advanced 50c. a ton and is now quotable at $15.50 to $16, delivered at local consumers' yards. Hydraulic compressed sheets are unchanged, but the No. 2 heavy melting steel grade is stronger, and the sentiment in the market is temporarily optimistic. The scrap market may be expected to gain strength even though steel mill operations are no higher, as the establishment of a fairly steady rate eliminates the uncertainty brought about by holdups in a declining market. In the opinion of some dealers, scrap may advance rather sharply in January, while others believe that present conditions do not suggest anything more than a gradual upward trend in quotations. Specialties are still strong, while the lighter grades, such as machine shop and blast furnace turnings, are unchanged in a listless market.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.50 to $16.00
No. 2 heavy melting steel	14.00 to 14.50
Scrap rails	14.00 to 14.50
Compressed sheet steel	15.00 to 15.50
Bundled sheets, sides and ends	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
Sheet bar crops, ordinary	18.00 to 18.50
Heavy breakable cast	11.00 to 11.50
No. 2 railroad wrought	15.50 to 16.00
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	10.00 to 10.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.00 to 20.50
Railr. coil and leaf springs	20.00 to 20.50
Rolled steel wheels	20.00 to 20.50
Low phos. billet and bloom ends	20.50 to 21.00
Low phos., mill plates	20.50 to 21.00
Low phos., light grades	19.50 to 20.50
Low phos., sheet bar crops	20.50 to 21.00
Heavy steel axle turnings	14.00 to 14.50
Electric Furnace Grades:	
Low phos., punchings	18.50 to 19.00
Hvy. steel axle turnings	14.00 to 14.50
Blast Furnace Grades:	
Short shoveling steel turnings	10.50 to 11.00
Short mixed borings and turnings	10.50 to 11.00
Cast iron borings	10.50 to 11.00
Rolling Mill Grades:	
Steel car axles	19.50 to 20.50
Cupola Grades:	
No. 1 cast	14.00 to 15.00
Rails 3 ft. and under	17.50 to 18.50

Common wire nails, per keg	2.80 to 2.90
Cement coated nails, per keg	2.95 to 3.05

Youngstown

Improvement in Steel in January Expected

YOUNGSTOWN, Dec. 23.—There is a growing feeling of optimism in the iron and steel trade of northeastern Ohio that conditions will show substantial improvement after the turn of the year. Sales departments report that inquiries are more numerous and that orders have been received the last 10 days in larger numbers and for larger tonnage. Hence, an upturn in schedules after the holiday season is expected.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and under 10-in., Pittsburgh	$34.00
Rerolling, 4-in. and under 10-in., Youngstown	34.00

Chicago

Western Storms, Delaying Steel Shipments, Bring Larger Orders From Consumers Whose Stocks Are Low

CHICAGO, Dec. 23.—Shipments of finished steel from Chicago mills have been curtailed as a result of severe winter weather which not only has hindered mill transport departments but also has handicapped railroads in switch yards and on mail lines.

This situation has worked hardships on some manufacturing consumers of steel, who have permitted their stocks to run exceedingly low. In order to better cover their needs, many consumers are sending in increased specifications to the mills, and in many instances instructions for prompt shipment are included. As a result, specifications exceed shipments for the first time in many weeks. New buying also is heavier, with the total reaching close to the current rate of shipments.

Chicago mills will shut down this week only for the 24-hr. period of Christmas Day. Ingot output ranges from 60 to 65 per cent of capacity. Twenty-two of the 36 steel company blast furnaces in the district are active.

With transportation digging its way out from under ice and snow, it can reasonably be expected that the drop in output due to the holiday will be offset by the freer movement of cars in mill yards and on the railroads.

Car shops continue to take liberal quantities of steel. Shipments of plates to the Milwaukee pipe maker are expanding.

It is computed here that for the country as a whole more than 100,000 cars have been ordered this year and that about 75 per cent of these have been placed in Western shops.

Orders for structural material continue to expand from a wide territory surrounding Chicago. Public utility programs are well under way, with contracts placed this week for three large additions to power plants in the Middle West.

Pig Iron.—Although shipments of Northern pig iron are dropping as the holidays approach, there is the encouraging feature of this market that fresh inquiries are growing rapidly, and buying for the first quarter shows marked improvement. Requests for prices indicate that 5000 to 10,000 tons will be placed at an early date. The local Southern iron market is quiet, with most quotations at $13.50 a ton, Birmingham. Quotations on silvery remain mixed, a local user having been offered a small tonnage of the 15 per cent grade at $38.50 a ton, Jackson County furnace. The local charcoal iron market is quoted at $24, furnace, on a large part of current sales, but prices are quite frequently named near $20 a ton to a widening circle of so-called non-users.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—A small lot of resale spiegeleisen is being offered here at $29 a ton, Hazard, Pa. The ferromanganese market is quiet except for the signing of a few contracts which have been slow in being brought to a close. A Middle Western user has closed for 500 tons of 25 to 30 per cent of ferrosilicon.

Bolts, Nuts and Rivets.—This industry continues to produce between 55 and 60 per cent of capacity. Stocks in the hands of most users and distributers are of moderate size, as indicated by the frequency of orders. Quite a number of first quarter contracts have still to be signed by consumers, many of whom have not acted as quickly in this respect as has been their custom in previous years.

Plates.—Local plate mill operations are steady, with satisfactory schedules for shipment to the pipe maker and car shops. A Western oil refiner is in the market for 4000 tons of tank plates, and two gas holders in San Francisco will take 2500 tons. Recent surveys made in the West forecast a satisfactory volume of business to be placed in 1930 by oil producers and operators of gas and oil lines.

Bars. — Specifications from manufacturers of automobiles for mild steel bars, as well as alloy steel bars, show some improvement. Mild steel is moving in larger quantities to builders of farm machinery which are under way with harvesting machinery production programs. Releases by road machinery makers are smaller, but this is looked on as a seasonal condition, as their order books are of good size. Local rail steel bar mills continue to operate on a double turn basis, but incoming orders are light and backlogs are measurably smaller. Most users are pressing for deliveries, which can be made in about one week.

Structural Material. — Structural awards in the week total nearly 10,000 tons, of which fully 8000 tons is for four power plants being constructed by public utility companies. Of special note is the 3500 tons needed for the addition to the Waukegan, Ill., central station of the Public Service Co. of Northern Illinois. Fresh inquiry is for 1500 tons, in which is included steel for additions to two power plants. Shop schedules for the Illinois Steel Co.'s expansion program are growing rapidly, and some fabricated steel on these orders has been shipped to erection sites.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Sheets.—This market is quiet, as is usual at this time of the year. Many consuming plants which are closing down for the holiday week are placing business for delivery after Jan. 1. Jobbers report distribution light and, as a result, their replacement-of-stock orders from mills are at the low point of the month. Output is holding this week at 60 per cent of capacity. The hot mills at Milwaukee are down for the remainder of the year, but orders for future delivery are accumulating and it now seems probable that these units will start to operate in the first week in January. Forward buying, even in view of small stocks in the hands of consumers, has been disappointing to sellers. In the absence of buying that would afford real tests, prices are steady at 2.80 to 2.90c. a lb., delivered, Chicago, for black sheets; 3.55 to 3.65c. for galvanized sheets, and 2.35c. for the blue annealed product. Deliveries are prompt on all classes of sheets.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.80c. to 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Semi-Finished Steel. — The local market is quiet in both sales and shipments. Rerolling billets, 4 in. and under 10 in., Chicago, are quoted $36 a gross ton, Chicago.

Hot-Rolled Strip. — Mill schedules are a trifle heavier as specifications grow, principally from manufacturers of automobile frames. Prices are steady at 2.10c. a lb., Chicago, for strips 6 in. and narrower.

Cold-Rolled Strip.—New orders, both of future and spot character, are affording encouragement to producers of cold-rolled strip. Because of larger releases, output is growing, the average now being about 30 per cent of capacity. Deliveries are prompt.

Wire Products. — Winter weather, which, in recent days, has blanketed most of the country, has served as an

effective check to a growth in orders which was under way in the early days of last week. Storms have delayed mail and also have checked outdoor work. Although there is some enlargement in demands for wire by automobile parts makers, the pickup is less than the trade had hoped for earlier in the month. Wire mill stocks have been growing for many weeks and have reached the point where producers wish to hold them for the winter months. Accordingly, operations have been revised downward, the range now being 40 and 50 per cent of capacity. Western wire mills expect to close down for two days during the holiday period. Specifications for wire nails are in satisfactory volume, considering the time of the year. Much of this business is for prompt delivery, giving further evidence of the small size of stocks in jobbers' and dealers' hands.

Cast Iron Pipe.—St. Louis has closed for 50,000 ft. of 8-in. and 20,000 ft. of 6-in. pipe with the American Cast Iron Pipe Co., and 30,000 ft. of 12-in. and 10,000 ft. of 20-in. with the United States Pipe & Foundry Co. The latter order was for class B pipe and it was taken at $35.50 a ton, Birmingham. The freight rate to St. Louis is $5.58 a ton, bringing the delivered price to $41.08. This business was placed for immediate delivery. Detroit has closed for about 6500 tons of pipe with the Lynchburg Foundry Co. and the United States Pipe & Foundry Co. It is reported that prices did not hold in view of competition with foreign-made pipe. The quantities ordered were 1500 tons of 24-in., 2160 tons of 36-in., and 2900 tons of 42-in. Franklin County, Ohio, was to have taken bids Dec. 15 at Columbus on 15,000 ft. of 6 and 8-in. pipe. It is reported here that awards have been indefinitely postponed. James B. Clow & Sons have taken 200 tons of 8-in. pipe for Chicago. Several public utility companies have made inquiries for blanket prices on tonnages that are to be determined later. Among these is the United Gas Improvement Co.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Old Material.—The Chicago scrap market is gaining in strength, as indicated by the breadth of inquiries and the attitude of most brokers. Another indication is that railroads find bidding against offered lists to be more active, with resultant higher prices. The nearness of the end of the year causes most buyers to place orders for delivery after Jan. 1, but here and there urgent requests for prompt delivery are made by users who had underestimated nearby needs. One of the most severe blizzards in years has seriously handicapped preparation and loading of scrap in local yards. Switching facilities have been taxed to the limit and many delays in deliveries have occurred. This situation is a market factor and is readily used by sellers to support their contentions that consumers will pay higher prices. As to the extent to which the upward movement will go, there is little that can be said at this time. Most brokers, while looking for higher levels, do not anticipate that advances will be over a wide range. Dealers do not hesitate to pay $13 a gross ton, delivered, for heavy melting steel to be applied against old orders, and there is reason to believe that some brokers are going long of the market in this and several other heavy-tonnage grades. Visible supplies of cast iron borings have dwindled and, though users have offered $9.50 a ton, delivered, they have found no takers among sellers, who are paying $10 a ton for tonnages to apply against old orders and who wish to gain a long position in the market. The Santa Fe obtained $13.75 a gross ton, delivered, on a recent sale of heavy melting steel. Country scrap is still blocked from Chicago by low prices, curtailed melt and the strictness of inspections.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraul. compressed sheets	11.00 to 11.50
Drop forge flashings	9.75 to 10.25
No. 1 busheling	11.00 to 11.50
Forg'd cast and r'l'd steel carwheels	17.50 to 18.00
Railroad tires, charg. box size	17.50 to 18.00
Railroad leaf springs cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.00 to 18.50
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	15.00 to 15.50
Low phos. plates, 12 in. and under	15.00 to 15.50
Blast Furnace Grades:	
Axle turnings	10.50 to 11.00
Cast iron borings	9.25 to 9.75
Short shoveling turnings	9.25 to 9.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	14.50 to 15.00
Cupola Grades:	
Steel rails less than 3 ft.	16.50 to 17.50
Steel rails less than 2 ft.	18.50 to 19.00
Angle bars, steel	15.25 to 15.75
Cast iron carwheels	13.75 to 14.25
Malleable Grades:	
Railroad	16.25 to 16.75
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	17.50 to 18.00
Iron car axles	25.50 to 26.00
Steel car axles	15.75 to 16.25
No. 1 railroad wrought	12.00 to 12.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.00 to 12.50
Stove plate	10.50 to 11.00
Grate bars	10.75 to 11.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Rails and Track Supplies.—Three purchases of rails, two of which were by railroads and one by a manufacturer of frogs and switches, total 20,000 tons. A week ago it was estimated that small Western railroads would place 100,000 tons of rails soon after the first of the year. Fresh inquiries have augmented this figure, so that, even with this week's purchases, there still remains, according to estimates of local producers, more than 100,000 tons which will be added to books in the early part of the new year. The New York Central has closed for 14,000 tons of track accessories. Although it is known that a large tonnage is to be taken to accompany recent rail orders, none of this business is definitely before the trade. Rail mill output remains at the high rate reached several weeks ago. Track accessory departments continue to hold at a moderate rate of output. The light rail market is quiet.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Coke. — Shipments of by-product foundry coke are somewhat lighter, as most foundries plan to close down the last week in the month. However, production remains at the full capacity of local ovens. Prices are steady at $8 a ton, f.o.b. Chicago ovens, and $8.75 a ton, delivered in Chicago.

Reinforcing Bars.—Cold weather is cutting deeply into shipments of reinforcing bars from Chicago warehouses. Backlogs continue to dwindle, but the measurement of deliveries is taken more on the score of contractors' ability to place steel at this time of the year rather than by the size and number of orders placed. Shop operations are not above 30 per cent of capacity. Prices are still at the low point of the year, with only slight improvement in prospect on small tonnages of billet steel reinforcing bars. Estimators are busy on a fair amount of new business. The University of Illinois will build a new chemistry building at Urbana, Ill. School buildings in Chicago promise a substantial tonnage early in the new year.

Norton Co. Opens New Cleveland Building

The Norton Co., Worcester, Mass., has opened a new service building in Cleveland, at 1306 East Fifty-fifth Street, where all divisions of the company will have their district headquarters. This is the third district building opened by the Norton Co. within three years; the others are at Philadelphia and Detroit. The Cleveland building, a two-story structure, 100 x 140 ft., contains offices, a truing room, service department and store rooms for stocks of grinding wheels. The Cleveland district personnel of the company will be enlarged, but A. R. Sandine remains in charge of the grinding wheel division and M. E. Mattson continues as sales manager of the grinding machine division. The Cleveland Tool & Supply Co., 1427 West Sixth Street, Cleveland, continues as agent.

New York

50,000 Tons of Structural Steel for Empire State Building Awarded—Pig Iron Sales 8500 Tons

NEW YORK, Dec. 23.—Pig iron sales at 8500 tons, again represented an encouraging total in view of the inclusion of a considerable number of small lots. It is evident that, while most melters are not ready to commit themselves very far ahead, they must cover for their nearby requirements. Unshipped tonnage that will be carried over into 1930 will probably be below normal, since forward contracting has been light and there have been few suspensions of deliveries against past commitments. Some buyers will have enough iron to last them through the first quarter, but as a rule carryover tonnage will not last foundries through January. Many continue to buy spot iron for their closeby needs. Pending business in the market exceeds 10,000 tons. The General Electric Co. is inquiring for nearly 5000 tons, including 1150 tons for Bayway, N. J., 1000 tons for Pittsfield and Lynn, Mass., 700 tons for Schenectady, N. Y., and 2000 tons or more for other plants. The Eastern Malleable Iron Co., Bridgeport, Conn., is in the market for 1500 tons of foundry and malleable. The inquiry for the Worthington Pump & Machinery Corporation for 825 tons is still unsatisfied. Many foundries are shut down in the current week for inventories, but the outlook is for no further recession in melt than has recently occurred. Some of the manufacturers of radiators and domestic furnaces have suffered more than the usual seasonal slump, but electrical equipment and heavy machinery makers continue active. Prices on Southern iron for delivery in this section have been unaffected by the 50c. advance in the Alabama market, and prices on Northern brands are unchanged, although possibly more flexible than heretofore.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.91 to $22.41
*Buff. No. 2, del'd east. N. J.	20.28 to 20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Interest has centered on structural steel, which continues unusually active despite the proximity of the Christmas holidays. Contracts placed in the New York metropolitan area in the past week will require close to 70,000 tons of steel, of which about 50,000 tons will go into the Empire State Building at Fifth Avenue and Thirty-fourth Street on the former site of the Waldorf-Astoria Hotel. This job was let on Friday, Dec. 20, to the American Bridge Co. The exact tonnage which it will take is not known, since plans have not been completed. However, it is safe to say that it will be in the neighborhood of 50,000 tons, which puts it among the largest awards on record. A subway section needing 6800 tons of steel was another sizable letting of the past week. Action is expected soon on 17,800 tons of steel for an elevated section of the municipal subway in Brooklyn. Apartment construction is proceeding at a rapid rate in New York and a substantial amount of the tonnage awarded in the last month has been for that type of work. Aside from structural steel, the market reflects the dullness incident to the holiday season and to the inventory period. Orders and specifications have been light, and little improvement is expected until the second week of January. Sheet steel bookings have been of fair volume for this time of the year, while wire goods are sluggish. Bars and plates are moving slowly. Prices have not changed.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.09½c. to 2.14½c.; bar iron, 2.14c.

Cast Iron Pipe.—A moderate tonnage of pressure pipe is being inquired for, but awards are not expected until after the first of the year. Contractors' bids for a sewage disposal plant requiring about 150 tons of 48-in. pipe and fittings have been opened by the Westchester County Sewage Commission, but no award has been announced. Sizable tonnages of gas pipe are pending for the United Gas Improvement Co., Philadelphia, and the American Construction & Securities Co., New York, and water pipe for the Federal Water Supply Co., New York. Prices of pipe continue irregular and lacking in firmness, with most foundries in need of tonnage.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Reinforcing Bars.—The volume of business this month has dropped off sharply from the level maintained in November. There is a moderate amount of pending work, but almost all of it has been held up until early in January. Meanwhile, prices are steady and unchanged.

Warehouse Business.—December has been a decidedly quiet month, with considerably less business than a year ago. Galvanized sheet prices, which began to develop a tendency to weakness about a week ago, have been placed on a quantity differential basis, effective Dec. 21, so that No. 24 gage is quoted at 4.50c. a lb., for lots of less than 50 bundles and 4.25c. a lb., base, on orders for 50 bundles or more.

Coke.—Shipments have held up very well, although affected during the current week by plant shutdowns. Standard furnace coke ranges from $2.65 to $2.75 a net ton, Connellsville. By-product foundry coke is quoted at $9 to $9.40, Newark or Jersey City, and $10.06, New York or Brooklyn. Special grades of beehive foundry coke still bring $4.85, Connellsville, or $8.56, delivered Jersey City or Newark, and $9.44, New York or Brooklyn.

Old Material.—Consumer buying of scrap has practically ceased, except for offers made in a few cases to buy at 50c. a ton less than the current quotation. A mill at Claymont, Del., which recently closed on about 5000 tons of No. 1 heavy melting steel at $14.50 a ton, delivered, is not in the market for further material, but has expressed willingness to consider purchases of No. 1 steel at $14 a ton. Other grades are decidedly inactive and No. 2 heavy melting steel prices show no increasing strength, despite offers of $14.50 a ton, delivered to a western Pennsylvania plant, by brokers with contracts. This is equivalent to $9.20 a ton, New York, while $8 a ton, New York, is the maximum offered for No. 2 steel for delivery to eastern Pennsylvania consumers.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$10.50 to $11.35
Heavy melting steel (yard)	7.50 to 8.00
No. 1 hvy. breakable cast.	10.00 to 10.50
Stove plate (steel works).	8.00
Locomotive grate bars....	8.25
Machine shop turnings....	7.00 to 7.50
Short shoveling turnings..	7.25 to 7.50

No. 1 machry. cast.....	$15.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	13.00
No. 2 cast (radiators, cast boilers, etc.)	12.50

Three Materials Handling Companies Merge

The Barrett-Cravens Co. and the Walker Vehicle Co., both of Chicago, and the Automatic Transportation Co., Buffalo, have been merged. All are manufacturers of materials handling equipment. The Walker Vehicle Co., a subsidiary of the Commonwealth Edison Co., Chicago, is one of the oldest truck manufacturers. The Barrett-Cravens Co. manufactures lift trucks, platforms, portable elevators and structural steel storage racks. The Automatic Transportation Co. is one of the pioneer manufacturers of electric industrial trucks and tractors.

Cleveland

Automobile Manufacturers Order Steel More Freely and Some Mills Increase Rolling Operations Slightly

CLEVELAND, Dec. 23.—Demand for finished steel from the automotive industry shows a considerable increase, mills having received during the week fairly good orders from some of the automobile manufacturers and parts makers for sheets, strip steel and steel bars. This business has enabled a few plants to further increase operations in their finishing departments to 50 per cent or more of capacity. Demand for steel from other consumers is light but fully as good as it was earlier in the month. As the inventory period is at hand, most consumers are paring their orders to a minimum in order to have stocks as low as possible on Jan. 1.

Several motor car manufacturers are lining up their steel requirements with a view of getting in production on new models or increasing their output of present models in January. The output of cars next month will show a considerable gain over that of December. The Ford Motor Co., which is planning a heavy production during the early months of the year, has placed some large orders with parts makers. It is understood that the Ford company aims to get its production up to 125,000 cars during January. Contracts for first quarter requirements of alloy steel bars have been placed by the two largest buyers of that steel in the automotive field. This industry has not done much contracting for the quarter for other steel products, most of the orders being for January requirements.

While some pressure for price concessions is coming from the automotive industry, mills report that automobile manufacturers generally appear satisfied with the continuation of the fourth quarter prices.

Pig Iron.—Considerable inquiry for first quarter contracts in lots up to 500 tons came out during the week. Sales were light and not much business is expected before the first of the year. The General Electric Co., which sent out a small inquiry recently, has put out an additional inquiry for several thousand tons for its various plants. Many foundries have shut down until after the holidays and have cut off on shipments. However, the decline in shipping orders this month has been less with some furnaces than expected because of releases that have come from some of the automotive foundries. Prices appear to be firmly maintained at $18.50, Cleveland, for foundry and malleable iron for out-of-town shipment and $19, furnace, for Cleveland delivery. In eastern Michigan, $20 furnace is being well maintained, but in the western part of the State $19.50 is rather commonly quoted.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.51 to 20.51
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley...	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6.01 from Birmingham.

Iron Ore.—The consumption of Lake Superior ore during November amounted to 4,700,925 tons, as compared with 5,365,813 tons in October, a decrease of 664,888 tons. In November, last year, the amount used was 4,897,404 tons. Furnace stocks Dec. 1 were 35,010,075 tons. The amount at furnaces and Lake Erie docks Dec. 1 was 41,499,687 tons, as compared with 40,080,106 tons on the same date a year ago. Central district furnaces consumed 2,263,513 tons in November, a decrease of 451,657 tons for the month. Lake front furnaces consumed 2,211,220 tons, a loss of 206,901 tons. Eastern furnaces used 115,302 tons, a decrease of 5404 tons, and all-rail furnaces used 110,890 tons, a decrease of 926 tons. There were 155 furnaces in blast using Lake ore Nov. 30, a loss of 25 for the month.

Semi-Finished Steel.—Specifications for sheet bars show a further slight gain, as some of the mills that cater to the automotive industry are getting busier. While a local mill has opened its books for first quarter contracts for sheet bars, billets and slabs at $34, Cleveland, consumers are as yet showing no interest in future commitments and no contracts have been closed. Considerable tonnage covered by fourth quarter contract will be carried over to the next quarter.

Wire Products.—There is considerable pressure for concessions on wire and, while there are reports of a 2.30c., Cleveland, price, the regular 2.40c. quotation appears to be well maintained. Nails are firm at $2.40 a keg. Orders are very light, as is usual at this time of year.

Sheets.—Orders for good-sized lots for January requirements were placed by the automotive industry in the Michigan territory during the week. These permitted some of the mills to increase operations. Several mills have shut down for the holidays. While there has been pressure for concessions on automobile body sheets in Michigan, if there has been any shading it has been exceptional. Prices on blue annealed sheets are still somewhat irregular. Black sheets are well maintained at 2.75c., Pittsburgh, and galvanized sheets are holding at a minimum of 3.40c.

Strip Steel.—Mills have taken some fair-sized orders from the automobile manufacturers in the Detroit terri-

tory, and several makers are operating their hot mills better than last week. Demand in the territory continues slow. Although prices on hot-rolled strip are holding fairly well, some round lot buyers appear to be able to secure concessions. Cold-rolled strip is firm at 2.75c., Cleveland.

Bars, Plates and Shapes.—There has been a moderate increase in steel bar specifications from the automotive industry, some for immediate delivery and some for shipment in January. Orders for small lots of plates show a slight gain. A local mill this week took several hundred tons from a locomotive manufacturer. While some bar business has been taken at 1.85c., Cleveland, and even as low as 1.80c. for a large tonnage, outside mills generally are holding to a 1.90c. base and have closed contracts at that price. One outside mill is naming 1.87½c., delivered, for Cleveland business. A number of consumers have closed first quarter contracts for plates and structural shapes at 1.90c., Pittsburgh. Reports of a 1.90c., Cleveland, price on plates are denied. While inquiry in the structural field is light, considerable building work is in prospect for the early part of the year.

Coke.—Ohio by-product foundry coke has been reestablished at $8.25, ovens, for January shipment. The demand is very light, as many foundries will be closed down the remainder of the month for inventories. Buying is of a hand-to-mouth character.

Old Material.—Sentiment in the market shows an improvement, and there is a little more activity than around the first of the month. This is probably due largely to the fact that mills in Youngstown, Warren and Canton, which were taking virtually no scrap two or three weeks ago, have released some shipments. Prices show a weak tone, although there is not enough business to offer a real test. No. 1 heavy melting steel is down about 50c. a ton. As high as $9.65 is being offered for machine shop turnings for shipment before the end of the month. Blast furnace scrap has declined about 25c. a ton. Dealers are now offering $9.50 to $10 for these grades. No. 1 cast scrap has declined 75c. a ton. A sale of forging crops is reported at $18.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$13.50 to $14.00
No. 2 heavy melting steel	13.00 to 13.50
Compressed sheet steel	12.50 to 13.00
Light bundled sheet stampings	11.50 to 12.00
Drop forge flashings	11.50 to 12.00
Machine shop turnings	9.00 to 9.50
Short shoveling turnings	11.00 to 11.50
No. 1 railroad wrought	13.00 to 13.50
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	12.00 to 12.50
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	9.75 to 10.00
Mixed borings and short turnings	9.75 to 10.00
No. 2 busheling	9.75 to 10.00
Cupola Grades:	
No. 1 cast	15.25 to 15.75
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.50
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Steel and Pig Iron Contracting Small—Mills and Consumers Closing Over Holidays

PHILADELPHIA, Dec. 23.—Steel mills and many manufacturing consumers of steel in this district are closing over the holiday period for a few days to a week. Buying has declined, and deliveries of pig iron and steel are generally being postponed until after Jan. 1. Steel contracting for first quarter has been limited, most buyers preferring to wait until the new year before purchasing. Prices show no further recession, and are being maintained more firmly on quotations for first quarter contracts than on small tonnages bought for delivery during the next 30 days.

Pig Iron.—Contracting for first quarter has covered only a small percentage of foundry iron requirements, most consumers preferring to cover their needs a carload at a time until their business develops a definite trend and prices show more firmness. The Newport News Shipbuilding & Dry Dock Co., Newport News, Va., which recently bought a small tonnage of foundry iron, has asked for prices on two carloads to be delivered before Dec. 31. The American Engineering Co., Philadelphia, is inquiring for about 1000 tons of various grades. This company inquired for a similar tonnage in August, but later abandoned the inquiry and covered its requirements as they arose. With buying light during the present month and with numerous postponements of deliveries until the new year, furnaces in the district have been accumulating some iron on their yards.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$20.76 to $21.76
East. Pa. No. 2, 2.25 to 2.75 sil.	21.26 to 22.26
East. Pa. No. 1X	21.72 to 22.76
Basic (del'd east. Pa.)	19.50 to 19.75
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.00 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Contracts have been renewed in a few cases for the next quarter, with the price firm at 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia.

Reinforcing Bars.—A moderate tonnage of bars has been inquired for in the past week, the Eighth Street subway, Philadelphia, requiring 750 tons and the Henry Avenue bridge, Philadelphia, on which new bids are being taken, about 600 tons. A small tonnage will be used in contract No. 7 of the Pennsylvania terminal improvement. Prices are unchanged, with billet steel bars at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia, and the extra for cutting to length usually omitted. Rail steel bars range from 1.80c. to 1.95c. per lb., Franklin, Pa., and Tonawanda, N. Y., or 2.12c. to 2.27c. delivered Philadelphia, with no extra for cutting to length or bending.

Shapes.—Tonnage on mill books is small, but some substantial structural steel projects are being inquired for, including 1000 tons in a new warehouse for Morris Wheeler & Co., Philadelphia, 2300 tons in the Eighth Street subway and 2400 tons in a new contract on the Pennsylvania terminal improvement. Prices continue at 1.90c. to 1.95c., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c., delivered Philadelphia. Occasionally 1.85c., f.o.b. mill, or 1.91c. a lb., delivered Philadelphia, is quoted to preferred buyers.

Plates.—Mills have closed a few contracts for first quarter with consumers who regularly buy ahead, but most users are still delaying commitments until after the beginning of the new year. Both contracts and sales for prompt shipment are being made at 2c. a lb., Coatesville, Pa., or 2.10c., delivered Philadelphia. Shipbuilders and other large preferred buyers of plates obtain the usual concessions made to purchasers of large tonnages.

Sheets.—Most mills are endeavoring to maintain 2.75c. a lb., base, for first quarter black sheet contracts, but

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅛-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel planished	4.30c.
Reinforc. steel bars, sq., twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex.	3.50c.
Cold-fin. steel, sq. and flats	4.00c.
Steel hoops	3.55c.
Steel bands, No. 12 to ⅛-in. inclus.	3.30c.
Spring steel	5.00c.
*Black sheets (No. 24)	3.90c.
†Galvanized sheets (No. 24)	4.65c.
Light plates, blue annealed (No. 10)	3.25c.
Blue ann'l'd sheets (No. 13)	3.40c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅛-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

on current buying for delivery over the next 30 days, 2.65c., Pittsburgh, or 2.97c., Philadelphia, has been quoted and occasionally 2.60c., Pittsburgh, or 2.92c., Philadelphia. Galvanized sheets are being maintained at 3.40c., Pittsburgh, or 3.72c., Philadelphia, both for contracts and early delivery. Blue annealed sheets are quoted at 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage, and blue annealed plates, No. 10 gage, at 2.20c., Pittsburgh, or 2.52c., Philadelphia. The usual concessions of $2 to $4 a ton are granted to automobile manufacturers and other preferred buyers.

Imports.—In the week ended Dec. 21, arrivals at this port consisted of 2500 tons of iron ore from Persia, 1199 tons of pig iron from British India and 12 tons of chrome bearing steel from Sweden.

Old Material. — Consumer buying has reached the lowest point of the year, the only feature of the past week having been the purchase of about 10,000 tons of No. 1 heavy melting steel by a Coatesville, Pa., consumer at $14.50 a ton, delivered. Although mills are offering to buy heavy melting steel at $14 a ton, delivered, brokers are unwilling to enter into contracts, as they are encountering some difficulty in buying good material at $14 a ton, especially with a stronger scrap market in the Pittsburgh district.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	$14.50
Scrap T rails	14.00
No. 2 heavy melting steel.	$12.00 to 12.50
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	13.50
Hydraulic compressed, old.	12.00 to 12.50
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equiv.)	12.50 to 13.50
Cast borings (for steel works and roll. mill)	11.00
Heavy breakable cast (for steel works)	13.50 to 14.00
Railroad grate bars	11.00 to 11.50
Stove plate (for steel works)	11.00 to 11.50
No. 1 low phos., hvy., 0.04% and under	21.00 to 22.00
Couplers and knuckles	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.00
Shafting	19.00
Steel axles	20.00 to 21.00
No. 1 forge fire	13.00 to 13.50
Cast iron carwheels	15.50 to 15.75
No. 1 cast	15.00 to 15.50
Cast borings (for chem. plant)	14.00 to 14.50
Steel rails for rolling	15.50 to 16.00

Eaton, Rhodes & Co. to Sell Pig Iron for Republic

The appointment of Eaton, Rhodes & Co., Cincinnati, by the Republic Iron & Steel Co. as sales agents for Pioneer pig iron has been announced. The arrangement covers Ohio and parts of Indiana, Kentucky and West Virginia. Pioneer pig iron is produced at the Birmingham plant of the Republic Iron & Steel Co., which has recently been equipped to cater extensively to the demand of foundries in the territory above mentioned.

Canadian Pig Iron and Steel Output Declines

Production of pig iron in Canada for November, at 86,516 gross tons, was 5 per cent under the total of 91,409 tons of October. The decline was in the basic and malleable grades. Basic iron dropped to 59,914 tons from 63,011 tons and malleable iron, at 7160 tons, fell from 9084 tons in the previous month, while foundry iron, at 19,442 tons, made a slight gain over the 19,314 tons produced in October.

For the 11 months, the Canadian production of pig iron totaled 1,007,612 gross tons, a gain of 8 per cent over the 934,085 tons reported for the corresponding 11 months of 1928.

Output of ferroalloys in November amounted to 7418 tons, as compared with 7674 tons in October. For the year to Dec. 1, production totaled 73,024 tons, as against 40,073 tons for the corresponding period of 1928.

Production of steel ingots and direct steel castings in November, at 93,648 tons, reached the low point for the year.

This output was 19 per cent under the 115,674 tons produced in October and 14 per cent less than the 108,463 tons reported for November, last year. The decline was mostly in steel ingots, which dropped to 89,135 tons from 110,165 tons in the previous month, but steel castings also fell to 4513 tons, as compared with 5509 tons in October.

For the 11 months, the output of steel ingots and direct steel castings aggregated 1,297,273 tons, an advance of 14 per cent over the total of 1,137,160 tons made during the corresponding 11 months of 1928. This year's output to date included 1,233,154 tons of ingots and 64,119 tons of direct steel castings.

Sheet and Tube Company May Buy Acme Steel

James A. Campbell, chairman of the board, Youngstown Sheet & Tube Co. and James E. MacMurray, chairman, Acme Steel Co., Chicago, have confirmed reports that negotiations are in progress for the purchase of the Acme company by the Sheet & Tube company. No agreement has been reached. An appraisal of the Acme properties is being made for the Youngstown Sheet & Tube Co.

British 1929 Steel Output a Post-War Record

WASHINGTON, Dec. 24.—Estimates of the output of raw steel in Great Britain in 1929, based on production for the first 11 months, indicate that if the average rate of output is maintained during December a post-war record will be established, according to a report from London to the Department of Commerce. Pig iron output is almost as satisfactory and it is apparent that the 1929 total will be exceeded by only one post-war year. Estimates place steel production at 9,650,000 tons and pig iron at 7,500,000 tons.

The gain in output is ascribed to increased demand from the shipbuilding industry and to high prices and extended deliveries on Continental steel. It is stated, however, that British financial returns will not be commensurate with the increased production, as higher prices were more than offset by increases in costs of raw materials, particularly coke and iron ore.

Engineers Elect Technical Committee Chairman

Chairmen of the four standing technical committees of the American Society Mechanical Engineers for 1930, elected at the society's recent annual meeting in New York, are as follows: Fred R. Low, editor of *Power*, chairman of the power test codes committee (reelected): Robert L. Streeter, vice-president of the United States Aluminum Co., Pittsburgh, to head the research activities of the society; and Harold W. Mowery, safety engineer, American Abrasive Metals Co., New York, chairman of the standing committee on safety. Edward J. Kearney, secretary and treasurer of the Kearney & Trecker Corporation, Milwaukee, and a former president of the National Machine Tool Builders Association, was elected chairman of the standardization committee.

Skyscraper Is an Economic Necessity, Says Fabricator

Skyscrapers were declared to be economic necessities in modern city life by George E. J. Pistor, Hay Foundry & Iron Works, New York, a director of the American Institute of Steel Construction, in an address before a group of steel constructors of the New York district on Dec. 21. He stated that the skyscraper should be appraised for its contribution to the advancement of American civilization as well as for its contribution to architectural art.

American Rolling Mill Co. to Shut Down Elyria Mill

The American Rolling Mill Co. will shut down indefinitely its plant at Elyria, Ohio, and will produce cold-rolled strip steel hereafter at the plant at Butler, Pa. The Butler unit has been the source of supply of hot-rolled strip for the Elyria operation. It was considered more economical to transfer this finishing operation to Butler. The nucleus of an organization will be maintained at Elyria, and some cold-rolled products which cannot be made at Butler may be produced there. The Elyria unit was acquired by the American Rolling Mill Co. in its purchase of the Columbia Steel Co., which owned both the Butler and Elyria mills.

Birmingham

Furnaces Book Some First Quarter Pig Iron Orders at 50c Advance—New Steel Business Declines

BIRMINGHAM, Dec. 23. — Furnaces have booked a few pig iron tonnages for first quarter delivery at $15, base, an increase of 50c. a ton. The usual lull in buying that comes at this season prevents any estimate as to how well the new price will be taken by the trade, but the impression is general that the new year will usher in improved business and, as consumers' stocks in many instances are low, actual requirements are expected to force a demand. On the other hand, there is the unfavorable factor of a large carry-over by several of the important melters. Shipments were very light during the past week. Sixteen furnaces remain active. Of this number, nine are on foundry iron, six on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50 to $15.00
No. 1 fdy., 2.25 to 2.75 sil.	15.00 to 15.50
Basic	14.50 to 15.00

Finished Steel.—New business in all lines declined last week, as was expected under the influence of the inventory and holiday periods. However, in the several lines that had been moving exceptionally well in previous weeks, the decline is less than usual at this time of year. Specifications are likewise lighter. Major operations in the district are to be closed down for from three to five days this week. All prices are the same. Pending projects for structural steel give the market a good tone. Plants will begin the year with considerable business on the books. The Ingalls Iron Works Co. received an order for 400 tons for the Texas Gulf Sulphur Co., to be erected near Bowling, Texas, and the Virginia Bridge & Iron Co. will furnish 120 tons for an addition to the Lamson & Sessions Bolt Co. plant here. Reinforcing bar business continues light.

Cast Iron Pipe.—The only encouraging feature of the market is the increase in inquiries from utilities and municipalities, indicating that there will be a favorable season from these fields. Bids were opened last week on a few projects above 100 tons each, but no contracts were placed. Plants are closed down this week but, with a few exceptions, operations will be resumed first of next week. Shops have been taking advantage of recent light operations to make needed repairs in preparation for better activity expected next month. Quotations are firmer at $37 to $38 a net ton, Birmingham, for 6-in. and larger sizes.

Coke.—Foundry and industrial coke producers and dealers received numerous instructions last week to suspend shipments during the holiday season. Only eight ovens are idle of a total of 1380. The price remains at $5 a net ton, Birmingham.

Old Material.—Foundries have been closed down for the holiday period and only two or three of the larger mills continue to take scrap on contracts. The smaller foundries have light stocks and dealers are expecting a good demand for most grades of scrap when operations are resumed with the turn of the year. Quotations are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

Boston

Large Volume of Structural Steel Work in Prospect—Pig Iron Weak, Scrap Firmer

BOSTON, Dec. 23.—The most important iron sale made the past week was 800 tons of malleable to a Worcester, Mass., foundry at the equivalent of $16.75 a ton, Buffalo. Business otherwise was confined to small lots, mostly No. 2X, at the equivalent of $17 and $17.50 a ton, Buffalo. Total bookings fell short of 4000 tons. A Vermont foundry, feeling out the market on 1000 tons of No. 2X, is reported to have obtained an offer of less than $17 a ton, Buffalo, and low prices are said to have been made on 2150 tons wanted by another foundry. Another inquiry for 500 tons is in the market. A consignment of Dutch iron arrived there the past week, the first in a long time.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$21.91 to $22.41
*Buffalo, sil. 2.25 to 2.75	21.91 to 22.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates; $4.91 all rail from Buffalo; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Cast Iron Pipe.—A Massachusetts utility company has purchased 3000 tons of gas pipe. At least two other New England utilities are expected to close on 5000 tons within the next week. Salem, Mass., has placed 100 tons of 6 and 8-in. water pipe with the Warren Foundry & Pipe Co. Boston will, it is reported, be in the market shortly after Jan. 1 for several thousand tons of pipe, and numerous other New England municipalities will buy more heavily than usual during January and February. Foundries are offering fewer concessions on large sizes of pipe than heretofore, and the market on small appears firmer than it has been in some time. Foreign pipe apparently has faded out of the picture. Prices quoted on domestic pipe openly are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10 ; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe.

Fabricated Steel.—Steel fabricators report that never before was so much tonnage in the making as now. Specifications on the bulk of this work will come out early next year. Considerable interest is shown by fabricators in the proposed Edison Electric Illuminating Co.'s Boston office building, due to the fact that all of its field connections are to be welded and that many wind braces are involved. The building will be 15 stories and require approximately 1300 tons of steel.

Old Material.—Little or no gain in the movement of scrap is noted, but indications are that business will be better shortly after Jan 1. Pittsburgh mills are in the market for certain materials, supplies of which are limited in New England. Because of this demand prices in some cases are firmer. Consumers of chemical bor-

Canada

Forward Buying Starts in Pig Iron

TORONTO, ONT., Dec. 23.—First quarter pig iron buying is the feature of the market. Inquiries are growing in number. Substantial tonnages for forward delivery were booked during the week, and others are pending for closing before the end of the year. The chief demand is for foundry iron, although some booking has been done in malleable. The demand for basic iron is small. Prices are unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10

St. Louis

Pig Iron Market Strengthens Due to Birmingham Advance and Denial of Freight Rate Decrease

ST. LOUIS, Dec. 20.—The increase of 50c a ton in the price of Southern pig iron to $15, Birmingham, has tended to give the market a firmer tone, while another strengthening factor has been the action of the Interstate Commerce Commission in denying the application of Southern interests for a reduction of 73c. a ton in freight rates to St. Louis and related or intermediate points in Illinois or Indiana. Sales for immediate shipment are confined to small lots. Some inquiries are being received for first quarter delivery. Sales of a leading Southern maker for December are said to equal the average for December.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92 to 19.42
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Business in plates, shapes, and bars and sheets during the past week has been quiet, due to the approach of the holiday period. No business of importance is expected until after the turn of the year. Warehouse trade also is seasonally quiet, and smaller in volume than a year ago. Structural fabricators complain of dull trade. The low bidder for the general contract for the River Des Peres sewer project, requiring 2000 tons of reinforcing bars, is the Stiers Brothers Construction Co., St. Louis.

Old Material.—The market for old material continues quiet. A few sales were made for prompt shipment, but the lots were small and for mixtures. Consumers generally are waiting until after Jan. 1 before making additional purchases, but dealers expect a good buying movement then. Prices are unchanged. Railroad lists: Atchison, Topeka & Santa Fe, 5160 tons; St. Louis-San Francisco, 44 carloads; New York, Chicago & St. Louis, 45 carloads.

Relay. rails 70 lb. and over	26.50 to 29.00

Buffalo

Pig Iron Sales Chiefly in Small Lots for Prompt Delivery—Demand for Finished Steel Low

BUFFALO, Dec. 24.—About the only sizable pig iron inquiries that are still open are those of the Worthington Pump & Machinery Corporation for 600 tons of foundry, and the General Electric Co. for 4000 tons of foundry and malleable. Most of the producers report quite a volume of 50 and 100-ton lots. Shipments against old orders are very good. Almost everything being sold at present is for prompt delivery. There is an inquiry for 300 or 400 tons of foundry and malleable from a district consumer. The price here in the district is steady at $19.50, with no immediate prospect of any change. Foundries appear to be satisfied with this price

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

and, while they do not believe the price is going down, neither do they believe that it will go up, so they are buying only for immediate needs. The going price for New England business seems to be $17.50, though it is possible that $17 could be done on a sizable tonnage.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.00 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Demand for most of the finished lines is low. The Lackawanna plant of the Bethlehem Steel Co. has increased operations to 18 of 24 open-hearths, with most mills on single turn and some on double turn. A local fabricator has taken 150 tons of structural steel for an addition to the plant of the Republic Carbon Co., Niagara Falls, N. Y. Half a dozen other small fabricated structural orders are reported, all less than 100 tons each. Demand for reinforcing bars has dropped off, with nothing of size in immediate prospect.

Old Material. — Consumers are watching their stock piles carefully during the inventory period, and there is no disposition on their part to add to their accumulations. No important sales have been made in this district during the past week. Dealers are buying against old orders for No. 1 heavy melting steel at $13.75, and it is possible that a mill seeking a tonnage of No. 1 could obtain it at $14, the last price paid here.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00
No. 2 heavy melting scrap	12.50
Scrap rails	$13.00 to 14.00
Hydraul. comp. sheets	12.50
Hand bundled sheets	10.50 to 11.00
Drop forge flashings	12.50 to 13.00
No. 1 busheling	12.50
Hvy. steel axle turnings	12.50 to 13.00
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	10.50 to 11.00
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50

Rolling Mill Grades:	
Steel car axles	16.50 to 17.00
Iron axles	20.00 to 21.00
Cupola Grades:	
No 1 machinery cast	14.50 to 15.00
Stove plate	12.15
Locomotive grate bars	10.00 to 10.50
Steel rails, 3 ft. and under	17.75 to 18.00
Cast iron carwheels	11.50 to 12.00
Malleable Grades:	
Industrial	16.50 to 17.00
Railroad	16.50 to 17.00
Agricultural	16.50 to 17.00
Special Grades:	
Chemical borings	12.00 to 12.50

The New York Aviation Show will be held Feb. 7 to 15, in Grand Central Palace, New York, under the auspices of the Aviators' Post No. 743, American Legion.

Cincinnati

Pig Iron Sales Total 3500 Tons But Demand Is Below Normal—Sheet Sales Gain Slightly

CINCINNATI, Dec. 23.—District consumers of pig iron entered the market for a total of about 3500 tons of iron last week. While this is slightly more than in the preceding week, the general demand for first quarter is still sluggish. Among the sales last week were several totaling 800 tons to Michigan consumers of low phosphorus iron for special work. A Cincinnati buyer took 200 tons of Southern foundry iron at a price which figures about $14.50, base Birmingham. A Northern furnace received an order from a Connersville, Ind., consumer for 400 tons of foundry iron and one for 150 tons of the same grade from a Dayton, Ohio, melter. These sales were for first quarter delivery. The remainder of the week's business was in small quantities for early consumption. Although Southern furnaces announced last week an increase in the base price of Southern iron at Birmingham to $15, this new quotation does not affect the market north of the Ohio River. District furnace representatives indicate that the price in this area will continue at about $14.50, base Birmingham, with possible concessions of about 50c. on substantial tonnages. The only inquiry before the trade is from a central Ohio melter for 400 tons of Northern foundry iron for first quarter.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—With a slight increase in new bookings and a concurrent advance in production schedules, district sheet mills indicated that the low point in the demand had passed. In fact, a strengthening of buying confidence was reflected in the placing of several orders for advance rolling of approximately 30 days.

Output is about 60 per cent of capacity, a slight increase over the preceding week. Several automotive companies have specified their first quarter needs. Some are taking sheets only for production of new models.

Coke.—Prices on by-product foundry coke continue at about $10.05, delivered Cincinnati.

Old Material.—Although the continued steadiness of prices on old material is giving the market a slight undertone of firmness, dealers report that the movement of scrap both on contracts and on new orders is very slow.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$12.00 to $12.50
Scrap rails for melting	13.00 to 13.50
Loose sheet clippings	8.00 to 8.50
Bundled sheets	10.75 to 11.25
Cast iron borings	8.25 to 8.75
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.50 to 7.00
Rails for rolling	13.50 to 14.00

Pacific Coast

San Diego Pipe Line Calls For 5000 Tons of Plates—Good Structural Business in Sight

SAN FRANCISCO, Dec. 21. (*By Air Mail*).—Interest centers in the opening of bids next week on 5000 tons of plates for a pipe line at San Diego. Among the week's larger lettings were 450 tons of reinforcing bars for a grain elevator in Tacoma, booked by the Pacific Coast Steel Co., and 320 tons of structural shapes for a high school in South Gate, Cal., placed with Brombacher Iron Works.

Pig Iron.—Foundry activity has shown little sign of improvement and, as a result, sales and inquiries are limited to small lots for prompt shipment. Quotations are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—While awards of reinforcing steel bars this week were fairly numerous, the bulk of the lettings involved lots of less than 100 tons. In addition

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ⅛-in. and over	3.15c.
Small angles, under ⅛-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.90c.
Galv. sheets (No. 24)	5.30c.
Struc. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

to the grain elevator mentioned above, 325 tons for a power house for the Lake Cushman project, Tacoma, was placed with the Pacific Coast Steel Co. and the United States Steel Products Co. The Los Angeles Iron & Steel Co. was low bidder on 104 tons for Los Angeles. Bids have been opened on 306 tons for paving work in Los Angeles County and on 267 tons for a bridge at Santa Ana, Cal. Los Angeles out-of-stock prices are unchanged at 2.40c., base, on carload quantities and at 2.70c. on smaller lots. San Francisco prices are $2 a ton lower. Merchant bar steel is not active, but prices remain firm at 2.35c., c.i.f., coast ports.

Plates.—Among plate lettings this week were 225 tons for a 500,000 gal. steel tank and tower for Los Angeles, placed with the Pittsburgh-Des Moines Steel Co., and 800 tons additional for a penstock in Vancouver for the British Columbia Electric Railway Co., booked by the Vancouver Engineering Works. Bids will be opened Dec. 23 on 5000 tons for a pipe line at San Diego. Plate prices are weak, and 2.25c., c.i.f., appears general now, with desirable lots bringing quotations of $1 to $2 a ton under this figure.

Shapes.—Only one structural award in excess of 100 tons was placed during the week. This was 320 tons for a school at South Gate. Pending business, however, calls for more than 9000 tons. Prices on plain material continue firm at 2.35c., c.i.f.

Cast Iron Pipe.—While no large lettings of cast iron pipe were reported this week, two projects involving good-sized lots came into the market for figures. Los Angeles will open bids on Dec. 23 for 2650 tons of 16 and 24-in. Class C pipe, and Vancouver, B. C., will open bids on Jan. 6 for 358 tons of 6-in. Class C pipe. Bids have been opened on 134 tons of 2 to 8-in. Class B pipe for the improvement of Flower Street, Santa Ana, Cal. Bids were also opened at West Salem, Ore., for 140 tons of 4 to 8-in. Class B pipe. Pipe mill representatives look for a decided increase in demand in the early part of January.

New York Edison Co. and associated electric light and power companies serving the five boroughs of New York have approved a budget of $76,848,053 for construction purposes in 1930, according to an announcement by Matthew S. Sloan, president of these companies.

Business Survey Committee Appointed

Steps Being Taken by Chamber of Commerce of United States to Observe Developments in Trade and Industry

WASHINGTON, Dec. 24. — Reports indicate that various industries are already taking steps to fortify their position and to carry into effect the general purpose of maintaining economic stability, formulated at the conferences called by President Hoover and the subsequent National Business Survey Conference held on Dec. 5 under the auspices of the Chamber of Commerce of the United States. Announcement to this effect was made by Chairman Julius Barnes of the National Chamber in connection with making public a list of upward of 100 business executives to serve as the Business Survey Conference Committee. It will be the duty of this committee "to bring to a common focus information concerning conditions in typical lines of industry and trade and keep under continuous observation developments in the national business field."

Members of the committee will be asked to interpret and report from time to time on the condition and outlook in their several lines of industry. These reports are expected to disclose the major trends in business and to reveal whether there are weaknesses in the national economic structure. They will be submitted to the executive committee of the conference, previously announced, and made the basis for determining whether corrective measures are practicable and necessary. If such measures are decided upon, they will be brought to the attention of the individual members of trade associations through the conference committee.

In connection with steps being taken to accomplish the purpose of the business survey, it was stated that chambers of commerce are looking especially to the furtherance of public building programs and the stimulation of repair, replacement and betterment work during the winter months. Mr. Barnes has communicated with commercial organizations and trade associations concerning repairs and general betterment during the next few months.

He pointed out that the conference had suggested that advantage be taken in the next two or three months for repairs, maintenance, clean-up, general betterments, improvement, re-equipment and replacements prior to the spring period when the large public and private construction programs reported to the conference will be getting into full swing with consequent enlarged demand for labor and materials. It was stated that the Department of Commerce has set up a division of public construction, which is actively working to assist Federal, State and local authorities in development and coordination of their programs, while the trade associations and chambers of commerce are also cooperating in connection with both public and private major construction programs. It was suggested that "it will be distinctly helpful if you could set up some way to estimate the volume of the expenditures for repairs and betterments that will result for 1930 as compared with 1929 and particularly for the first three months of 1930 compared, if possible, with the corresponding period of the past year."

Mr. Barnes said it is quite likely that for the purpose of checking progress and comparison to guide action which may later be helpful, the chamber would in the near future suggest some method for these organizations to report progress at given intervals, perhaps monthly, for a short time.

Request has also been made by Mr. Barnes that the advisory committee report briefly on the existing situation and outlook in their respective fields as the year closes, so that information concerning business activities and the immediate outlook may be available for consideration in determining further steps to be taken to carry out the purposes of the conference. It was suggested that the reports be put into the mails by Dec. 28.

Among those named on the Business Survey Conference Committee are: James B. Bonner, Philadelphia, American Iron and Steel Institute; Gen. Otto H. Falk, Milwaukee, president, Allis-Chalmers Mfg. Co., representing machinery manufacturers; W. W. Coleman, Milwaukee, National Metal Trades Association; A. E. McKinstry, Chicago, National Association of Farm Equipment Manufacturers; Charles Piez, Chicago, Shovel and Crane Manufacturers' Association, and W. W. Wood, Decatur, Ill., American Institute of Steel Construction, Inc.

Westinghouse to Build $1,500,000 Laboratory

The Westinghouse Electric & Mfg. Co., East Pittsburgh, has announced the construction of a central engineering laboratory and an addition to the present direct current power laboratory at East Pittsburgh, to cost approximately $1,500,000. The new laboratory will eventually replace numerous smaller laboratories and experimental test stations now scattered throughout the plant, and will be in keeping with the company's tendency toward consolidation of its facilities at central points. Six upper floors of the new building will house engineering offices, and the remaining area will be devoted to miscellaneous experimental work. The new laboratory will be 11 stories, 80 ft. x 225 ft.

Exports Lower in November

Year's Total Will Be Largest Since 1920—Imports Well Below Last Year

WASHINGTON, Dec. 21.—Exports of iron and steel products from the United States for 1929 will be the largest since 1920, when they aggregated 4,927,800 gross tons. This became evident with the returns for November of 1929 showing exports to be 241,829 tons, bringing the total for the 11 months to 2,817,110 tons or only 45,887 tons under the total for 12 months in 1928, amounting to 2,862,997 tons, which was the largest annual movement since 1920. For the first 11 months of 1928 they aggregated 2,642,912 tons, which now is exceeded by 6½ per cent.

Assuming that December, 1929, exports are only 240,000 tons, or less than the monthly average of 256,101 tons for the 11 months, the aggregate for 1929 would be 3,057,000 tons. The record export movement was in the war year 1917, with a total of 6,414,120 tons.

Imports in November, 1929, were 54,041 tons and for the 11 months of 1929 they amounted to 691,433 tons as against 727,310 tons for the corresponding period of 1928. For the 12 months of 1928 they were 782,694 tons.

Exports in November declined 54,041 tons from those for October. The principal exports in November, 1929, were scrap, 55,565 tons; plain structural shapes, 25,465 tons; skelp, 17,499 tons; tin plate, 16,781 tons; and plates, 16,698 tons. Canada was the principal market for the month, taking 102,524 tons in all. Other outstanding markets were Japan, 42,550 tons; Chile, 14,296 tons; Mexico, 7090 tons; the Philippine Islands, 7023 tons; and Italy, 6182 tons.

Imports in November were the next to lowest for any month of the year. Pig iron was the principal item of importation, incoming shipments being 12,702 tons. Next came structural shapes, 11,961 tons; scrap, 6843 tons; ferromanganese, 4654 tons; and wrought pipe, 3767 tons. Belgium supplied 10,410 tons of the total; Germany, 9218 tons; Canada, 9010 tons; India, 7053 tons; and the United Kingdom, 6473 tons.

Future of Coal a Chemical Problem

New Outlets to Compensate for Losses to Other Fuels and New Technique to Win Inherent Possibilities of Coal

"MODERN science dealing with fuel may draw to the coal fields new industries not thought of a generation ago," said Dr. Thomas S. Baker, Pittsburgh, president, Carnegie Institute of Technology, in addressing the recent convention of the American Mining Congress in Washington. Doctor Baker spoke on "The Laboratory as the Open Door to the Future of Coal."

He declared that the processing of coal will produce great quantities of gas which formerly was wasted, but which in the future may be piped to distant cities, so that some day the gas to be burned in New York may come from the coke ovens of Pennsylvania. Continuing Doctor Baker said, in part:

"Processing of coal will also produce great quantities of tar, which will be distilled probably near the mines, and the various stages of refining will create new enterprises out of what are now only laboratory experiments. Chemical industries are likely to draw more closely toward coal fields. Localities where coal is situated will grow in importance. The newer chemistry will bring about new industrial developments, many of which will take place in the regions where the basic material is found.

"Whatever may happen to other parts of our country, we can prophesy that those regions where soft coal is found will enjoy an ever-increasing activity and probably an expanding prosperity. We cannot foresee in just what respects science would cure the ills of the coal industry. We may be certain that it would not banish them as if by magic, but we may be confident that some of the apparently insurmountable difficulties will yield to the patience and hard work of the investigator.

"We are entering upon a new era of fuel technology and the demand for men educated in the new science will be very insistent. Our wealth of coal assures our country a long continuance of its industrial greatness. Undoubtedly coal will serve as the chief source of energy until some revolutionary discovery makes obsolete the physical theories of today. Even though we may harness every stream and watercourse in the country, the electricity thus gained will hardly furnish more than a third of the power demanded by future generations.

"We see inroads into the coal industry by new engineering and scientific developments. Railroads are moving more of their trains by electric power, generated in many instances not from coal, and oil-electric locomotives are supplanting some coal-burning engines. The problem of the coal industry is to find new uses, new outlets, and new employment for its commodity, and we are beginning to see that science can help in finding them.

"Search is being made for a satisfactory low-temperature distillation process which will increase the value of coal and provide a cheaper substitute for anthracite for domestic purposes, by transmitting low-grade bituminous into high-grade fuel. A development in coal chemistry is the production of synthetic petroleum from coal. One of the far-reaching discoveries of the coal chemist in an economic sense is the production of synthetic fertilizers. In time it may be profitable for the mine owner to fabricate his product and thus add to the value and the wealth of the country."

Stanley Electric Tool Co. Buys Two More

The Stanley Works, New Britain, Conn., through its subsidiary, the Stanley Electric Tool Co., has purchased two additional companies, the Crowe Mfg. Corporation, Cincinnati, and the L. R. Carter Co., Syracuse, N. Y. Both are manufacturers of electrically operated tools. A few weeks ago the Stanley company announced the purchase of the Unishear Co., New York, and the Ajax Electric Hammer Corporation, New York. These new acquisitions make the Stanley company one of the largest in the country in the manufacture of electric tools.

All of the companies except the Carter company will move to New Britain at once. The Carter plant will be moved later. The Stanley company plans the expansion of its district sales offices throughout the country.

Republic May Move Head Offices to Cleveland

The new Republic Steel Corporation may move its general offices to Cleveland, following the completion of the merger of the Republic Iron & Steel Co., the Central Alloy Steel Corporation, the Donner Steel Co. and the Bourne-Fuller Co. Meanwhile, industrial and business leaders of Youngstown have joined in an effort to retain the headquarters in that city.

Directors of the consolidated company have not yet chosen the executive headquarters. For years the Republic Iron & Steel Co. has maintained executive and general sales offices in its own building in Youngstown. Leaders in the movement to retain the headquarters in Youngstown include John T. Harrington and Philip Wick, who are associated with Cyrus S. Eaton in his merger plans; A. E. Adams, president First National-Dollar Banks, and H. W. Grant, president, Youngstown Chamber of Commerce.

Formal notices to stockholders of the proposed merger probably will be mailed shortly. Until the stockholders ratify the proposed action, further developments probably will proceed slowly.

Non-Ferrous Metal Markets

Copper Quiet, With Prices Firm—Zinc and Lead Sales Are Good

NEW YORK, Dec. 23.

Copper.—There has been little change during the past week. The amount of business has been small and for immediate delivery. Consumers see no reason to buy ahead, since they doubt whether the present price of electrolytic copper will be maintained long into the coming year. Furthermore, the nearness of the inventory period has been another factor in their decision to satisfy only current requirements. Large users still are pressing for an abandonment of the 18c. schedule, but seem less confident of success than a few weeks ago. Producers have previously demonstrated their ability to maintain the price under stress. A leading market observer predicts that if any break occurs, it will not come until the second quarter of 1930 and only then because producers think it expedient for the best interests of the industry as a whole rather than because of being compelled to yield to the pressure exerted by their customers. The few orders that have been placed have been well distributed among foreign and domestic consumers. Electrolytic copper for export is unchanged at 18.30c., c.i.f. usual European ports. Lake copper is firm at 18c. to 18.12½c., delivered.

Tin.—The trade is in the midst of a holiday market, with little interest being shown by consumers. The small sales reported in the past week have been mostly to dealers. The dullness has affected the price of spot Straits tin, which today was quoted at 39.50c., New York. Scarcely any news has come from London in regard to the group activities there and the developments in proposed mergers. The London market has declined slightly in the past week, and today spot standard was selling at £178 2s. 6d. and future standard and spot Straits at £181 2s. 6d. The price at Singapore was £184 12s. 6d.

Zinc.—At the beginning of the week, prime Western zinc dropped further to 5.45c., East St. Louis. The decline brought out heavy orders from users, who felt that the bottom had been reached. In fact, the volume of sales in the last fortnight, at 5.50c. and 5.45c., has been the best in several months. However, producers are reluctant to let consumers have all of the material they want at the pres-

Cast aluminum	10.00c.	12.00c.

ent level and therefore are not actively soliciting business. They are content to let their customers cover their requirements for the first quarter, but prefer not to make bookings indiscriminately at 5.45c.

Lead.—Substantial orders for January shipment have been received by producers. Some inquiries for February have appeared, but sellers are not willing to book business that far ahead. The good volume of sales is due to the belief of users that prices have been stabilized at 6.10c., St. Louis, and 6.25c., New York.

Antimony.—The market for Chinese metal remains dull, with prices for spot and future delivery at 8.37½c., New York, duty paid.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. a lb., shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Dec. 23.—Prices for copper and lead remain steady. Quotations on zinc, tin and antimony are lower. Sales in the past week have been in small volume. The old metal market is without feature.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 40.75c.; lead, 6.20c.; zinc, 5.60c.; in less-than-carload lots, antimony, 9.25c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 22c.; block tin, 32c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

St. Louis Improvements to Cost $12,000,000

Expenditure of $12,000,000 on public improvements during 1930 is planned by the city of St. Louis, according to William E. Rolfe, associate to the president of the Board of Public Service.

New buildings will involve $1,500,000, while $500,000 will go for the erection of bridges and viaducts. Foremost among the new buildings projects will be a $600,000 nurses' home and a bird house in the Zoo costing $202,000.

The remaining $10,000,000 will be spent for street paving, street reconstruction, sewer and drainage work. W. W. Horner, chief engineer of paving and sewers for the city, has estimated that in 1930 sewer and drainage work will aggregate about $4,050,000, while $5,650,000 will be spent for paving. Drainage, paving and surface work on the municipal airport will call for another $300,000.

A report entitled "Sharing Profits with Employees" has just been published by the Policyholders Service Bureau of the Metropolitan Life Insurance Co., New York. The survey is based on the experience of more than 80 companies.

Fabricated Structural Steel

Awards, at 90,000 Tons, Include 50,000 Tons for Empire State Building, New York

WITH awards at 90,000 tons, the past week was the second best of the year. This is regarded as a remarkable showing for late December, when the Christmas holidays generally cause a slump in activities. Over 75 per cent of the lettings were in the New York metropolitan area. The outstanding contract was for the Empire State Building, New York, which will be erected on the old site of the Waldorf-Astoria Hotel. This project, awarded on Dec. 20, will require about 50,000 tons of steel, although the exact amount is not yet known.

New work which appeared for bids in the past week totaled about 24,000 tons, of which 4000 tons is for a New York hotel. Awards follow:

BUCKSPORT, ME., 3500 tons, paper manufacturing plant, to New England Structural Co.

NEW YORK, 6800 tons, subway section, to Bethlehem Steel Co.; general contractor, Arthur A. Johnson Corporation.

NEW YORK, 1100 tons, apartment building, to Taylor-Fichter Steel Construction Co.; James Stewart & Co., general contractors.

NEW YORK, 200 tons, residence on East Side, to Easton Structural Steel Co.

NEW YORK, 50,000 tons, Empire State Building, to American Bridge Co.

NEW YORK, 1200 tons, trade school on Sixty-seventh Street, to Levering & Garrigues Co.

NEW YORK, 1000 tons, buildings for Hunter College, to unnamed fabricator.

NEW YORK, 1500 tons, apartment building at Eighty-ninth and Park Avenue, to Hay Foundry & Iron Works.

NEW YORK, 2000 tons, apartment building at Seventy-ninth Street and Amsterdam Avenue, to Hay Foundry & Iron Works.

NEW YORK, 300 tons, building at Seventy-ninth Street and Amsterdam Avenue, to Harris Structural Steel Co.

NEW YORK, 700 tons, 12-story apartment building on West Ninety-second Street, to Dreier Iron Works.

NEW YORK, 1100 tons, public school No. 238, to Bethlehem Fabricators, Inc.

NEW YORK, 400 tons, public school No. 224, to Bethlehem Fabricators, Inc.

NEW YORK, 1000 tons, apartment building at 250 West Seventy-second Street, to Harris Structural Steel Co.

NEW YORK, 1250 tons, building for Hanover Bank & Trust Co. at Church and Franklin Streets, to Heddon Iron Works.

BROOKLYN, 600 tons, 15-story apartment on Hanson Place, to Berkshire Iron Works.

BROOKLYN, 1100 tons, public school No. 241, to Easton Structural Steel Co.

SCHENECTADY, N. Y., 500 tons, City Hall, to Belmont Iron Works.

PENNSYLVANIA RAILROAD, 200 tons, bridge, to American Bridge Co.

NEW YORK, 200 tons, memorial building at 124 East 112th Street, to Grand Iron Works.

CLEVELAND, 1365 tons, building for National Town and Country Club, to McClintic-Marshall Co.

NAPERVILLE, ILL., 375 tons, building for Naperville College, to an unnamed bidder.

NIAGARA FALLS, N. Y., 150 tons, addition for Republic Carbon Co., to McClintic-Marshall Co.

PENSACOLA, FLA., 400 tons, Armstrong Court building, to Worden-Allen Co., Milwaukee.

BOWLING, TEX., 400 tons, Texas Gulf Sulphur Co., to Ingalls Iron Works.

BIRMINGHAM, 120 tons, addition to Lamson & Sessions Bolt Co. plant, to Virginia Bridge & Iron Co.

CINCINNATI, 1750 tons, railroad bridge for Cincinnati Union Terminals Co., to Mount Vernon Bridge Co.

GRANITE FALLS, MINN., 1900 tons, power plant, to Minneapolis-Moline Power Implement Co.

WAUKEGAN, ILL., 3500 tons, power house for Public Service Co. of Northern Illinois, to Mississippi Valley Structural Steel Co.

DULUTH, MISSABE & NORTHERN RAILROAD, 400 tons, bridge work, to American Bridge Co.

MILWAUKEE, 1500 tons, addition to Lakeside power plant of Milwaukee Electric Railway & Light Co., to Worden-Allen Co.

OKLAHOMA CITY, OKLA., 1000 tons, power house, to Stupp Brothers Bridge & Iron Co., St. Louis.

SOUTH GATE, CAL., 320 tons, high school, to Brombacher Iron Works.

LOS ANGELES, 225 tons plates, 500,000-gal. tank and tower, to Pittsburgh-Des Moines Steel Co.

VANCOUVER, B. C., 800 tons plates additional, penstock for British Columbia Electric Railway, to Vancouver Engineering Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 1800 tons, Edison Electric Illuminating Co. office building.

NEW YORK, 4000 tons, hotel at 228 West Forty-seventh Street.

NEW YORK, 1200 tons, apartment building on Seventy-second Street.

PHILADELPHIA, 2000 tons, highway bridge.

PHILADELPHIA, 1000 tons, Henry Street bridge.

PHILADELPHIA, 2400 tons, Contract No. 7 on Pennsylvania terminal improvement.

PHILADELPHIA, 2300 tons, Eighth Street subway; bids open Dec. 30.

PHILADELPHIA, 1000 tons, new warehouse for Morris Wheeler & Co.

ATLANTIC COAST LINE RAILROAD, 100 tons, bridge.

PITTSBURGH, 1300 tons, addition to Duquesne Club.

ROGERS CITY, MICH., 600 tons, power house for Michigan Limestone & Chemical Co.

CHICAGO, 500 tons, building for Dallas Brass & Copper Co.

SAN ANTONIO, TEX., 3600 tons, administration building for Southwestern Bell Telephone Co.

ST. LOUIS, 250 tons, garage for Union Electric Light & Power Co.

SEATTLE, 1000 tons, Washington Athletic Club; general contract to Sound Construction Co.

MIDWAY, FLA., 180 tons, mill building for Fuller's Earth Co., Cleveland.

CANTON, OHIO, 200 tons, store for Halle Brothers Co.

TOLEDO, 100 tons, branch exchange building for Ohio Bell Telephone Co.

RACINE, WIS., 300 tons, vocational school.

PERSONAL

JOHN A. TOPPING, chairman of the board, Republic Iron & Steel Co., has announced his retirement from active business. He has completed more than a half century in the iron and steel industry. Mr. Topping said that he had for some time contemplated retiring, and that the formation of the new Republic Steel Corporation afforded him the opportunity to shift the responsibility of business management to others. Mr. Topping said further that he was heartily in accord with

JOHN A. TOPPING

the merger, which, when concluded, would be highly beneficial to all interests. Mr. Topping started in the iron business in 1878 with the Aetna Iron & Nail Co., and became its president in 1898. Later the company was merged with another to become the Aetna-Standard Iron & Steel Co., and this in turn went into another merger and became a part of the American Sheet Steel Co., of which Mr. Topping was first vice-president. He resigned in 1903 and undertook the reorganization of the La Belle Iron Works. In July, 1904, he was elected president of the American Sheet & Tin Plate Co., remaining in that position until January, 1906, when he was made president of the Republic Iron & Steel Co. and chairman of the Tennessee, Coal, Iron & Railroad Co. He was made chairman of the Republic company in 1908, and had continued in that position for nearly 22 years. Mr. Topping has taken a very active part in the affairs of the American Iron and Steel Institute, of which he is vice-president.

—

GEORGE G. SMALL, vice-president, United Engineering & Foundry Co., Pittsburgh, has tendered his resignation and will retire from active business Jan. 1. He has been associated with the company and its predecessor for 36 years. Mr. Small was born near East McKeesport, Pa., in 1864, and attended the Indiana State Normal College, Indiana, Pa. Later he became identified with the Apollo Foundry Co. and the Apollo Iron & Steel Co., Apollo, Pa., the latter concern now the Vandergrift plant of the American Sheet & Tin Plate Co. In 1893 he became associated with the Lincoln Foundry Co., and when the United Engineering & Foundry Co. was organized in 1901, he was made manager of the Lincoln Foundry Co. department. He was elected second vice-president of the company in 1905, and first vice-president 10 years later. During his career with the company, Mr. Small has given special attention to the manufacture of chilled, sand and alloy iron rolls, and has become widely known for his technical and practical knowledge of this subject.

—

E. F. MARRESFORD, formerly with the American Machine & Foundry Co., has joined the sales staff of the Watson-Stillman Co., New York.

—

L. B. GREEN, formerly development engineer of the Borden Co., Warren, Ohio, has become works manager of the Globe Machine & Stamping Co., Cleveland.

—

W. B. PICKUP has been appointed special representative of the Positive Lock Washer Co., Newark, N. J.

—

F. H. DALRYMPLE has been placed in charge of the newly-opened Cleveland district office of the Union Chain & Mfg. Co., Sandusky, Ohio.

—

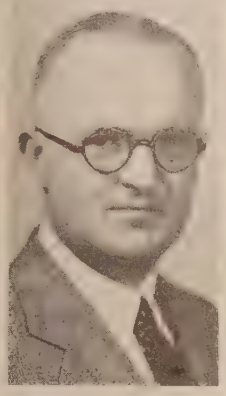
ARTHUR E. NORTON, Harvard Engineering School, Cambridge, Mass., discussed design and lubrication of bearings at the monthly meeting of the Plant Engineers' Club, Dec. 18, at the University Club, Boston.

—

RAY M. HUDSON resigns post as assistant director of the Bureau of Standards, in charge of commercial standardization, to become secretary of the Massachusetts Division of the New England Council, with headquarters in Boston. Ever since his graduation from Syracuse University in 1908, he has devoted himself largely to the study of simplification, standardization and scientific management methods, and today is recognized nationally as an authority on the elimination of industrial waste. Before being called by Mr. Hoover, then Secretary of Commerce, as technical assistant in the Division of Simplified Practice, he was associated for several years with Col. George D. Babcock, a member of the Hoover Committee on Waste in Industry, in the installation of scientific management methods in the plants of the H. H. Franklin Mfg. Co., Syracuse, and of the Holt Mfg. Co., at Peoria, Ill. During the war he served with the Emergency Fleet Corporation, as a production engineer in the procurement of machinery. In 1923, Mr. Hudson was made Assistant Chief of the Division of Simplified Practice, and in 1925, its Chief. With the creation, in September, 1927, of the commercial standardization group within the Bureau of Standards, he became an assistant director of the Bureau in charge of this work.

—

CHARLES E. MITCHELL has been appointed associate manager of the Gray Iron Institute, Cleveland, and will act as an assistant to Arthur J. Tuscany, the manager, in the executive work of the Institute. Mr. Mitchell is regarded as well qualified



CHARLES E. MITCHELL

for his duties dealing with accounting, merchandising and association promotional work as he has devoted his time to that work during the past 18 years. For 10 years he was accountant and office manager of the Ohio Bell Telephone Co., Cleveland. More recently he has been engaged in organization work, being the manager of a local Cleveland association from which he resigned to take up his duties with the institute.

—

C. K. EVERITT, heretofore managing director of Edgar Allen & Co., Ltd., Sheffield, England, has been elected chairman of the board of directors, succeeding ROBERT WOODWARD, who resigned.

—

JAMES H. EDWARDS, chief engineer, American Bridge Co., New York, has made the following appointments in the engineering department, effective Jan. 1:

R. R. GRAHAM, as assistant engineer, Eastern division, at 30 Church Street, New York; J. E. ELLIOTT, assistant engineer, Central division, Frick Building, Pittsburgh; F. W. DENCER, assistant engineer, Western division, 208 South La Salle Street, Chicago.

—

H. W. BOYD, formerly secretary, Tinius Olsen Testing Machinery Co.,

Philadelphia, who was elected vice-president, succeeding Thorsten Y. Olsen, the new president, has been connected with the company since 1888. He was successively shop foreman, superintendent for about 20 years and secretary for eight years.

—

HARRY G. UPHOUSE of the Donner Steel Co., Buffalo, who has been transferred by the company to the Buffalo office, where he will have charge of district sales of steel and pig iron, will be given a farewell dinner by friends in the Philadelphia district on Dec. 30, at the Penn Athletic Club.

—

FRANK W. FUNK has become managing engineer of the Jackson, Mich., division of Stevens & Wood, New York, engineers and constructors.

—

A. H. BOARDMAN, for the past seven years in the purchasing department of the Shell Oil Co., has been appointed manager of the San Francisco district, with offices at 39 Stevenson Street, San Francisco, for the Monarch Foundry Co., Stockton, Cal.

Obituary

J. C. WATERBURY, president, Waterbury Co., New York, manufacturer of wire rope, died from a fall from a train at Weehawken, N. J., Dec. 20, aged 49 years.

—

PRESCOTT I. JOHNSTON, for many years shop superintendent of the Consolidated Machine Tool Corporation of America, Rochester, N. Y., died in that city on Dec. 14.

—

SAMUEL BATES, president, Pioneer Thresher Co., Shortsville, N. Y., died suddenly as his home in Rochester on Dec. 18, aged 66 years.

—

E. H. PEARSON, New York district manager of the Electric Machinery Mfg. Co., Minneapolis, died on Dec. 7, aged 36 years.

—

ELLIOT J. BROWN, for the past 25 years chief engineer at the Washburn Wire Co., Philipsdale, R. I., died suddenly on Dec. 17. He was born at Mapleton, Pa., in 1871. Leaving Juniata College before he was graduated, he studied engineering and later was chief engineer at plants located at Altoona, Pa., and New Haven, Conn.

—

IRVING T. HARTZ, president, Morden Frog & Crossing Works, Chicago, died Dec. 17. He was, successively, secretary and manager of the Calumet Iron & Steel Co., president of the Union Cold Storage Co., vice-president of the Morden Works, and its president since 1907.

—

WILLIAM PATON THOMSON, vice-president, Rail Joint Co., New York, died in Atlantic City, Dec. 21, aged 57 years. Since his graduation from Princeton University in 1896, he had been identified with railroad engineering, devoting most of his time since 1906 to track problems.

Railroad Equipment

Reading Buys 2000 Cars; Inquiries Delayed

EXPECTED inquiries for railroad equipment have failed to materialize in the past week. Several roads are at the point of asking for bids on an aggregate of about 20,000 to 25,000 cars, but these prospects may not formally develop until January. The year's orders have totaled about 100,000 cars, the largest number purchased in one year since 1924. Details of the week's business follow:

Reading Railroad has awarded 2000 50-ton box cars, 600 each to the American Car & Foundry Co. and Bethlehem Steel Co. and 400 each to Pressed Steel Car Co. and the Standard Steel Car Co.

Southern Pacific will buy 10 baggage, five lounge and five dining cars.

Reinforcing Steel

Reinforcing Steel Awards

TACOMA, WASH., 450 tons, grain elevator, to Pacific Coast Steel Co.

TACOMA, 325 tons, power house for Lake Cushman project, to Pacific Coast Steel Co. and the United States Steel Products Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

PHILADELPHIA, 600 tons, Henry Avenue bridge; bids open Dec. 27.

PHILADELPHIA, 750 tons, Eighth Street subway; bids open Dec. 30.

CHICAGO, 360 tons, apartment building.

URBANA, ILL., tonnage being estimated, chemistry building for University of Illinois.

SACRAMENTO, CAL., 159 tons, highway work, San Mateo County; bids Jan. 8.

SACRAMENTO, 121 tons, highway work, Santa Clara County; bids Jan. 8.

LOS ANGELES, 104 tons for city; Los Angeles Iron & Steel Co., low bidder.

FLORENCE, ARIZ., 119 tons, cell house; bids opened.

Sheet Production and Sales Off in November

Sharp curtailment in the automotive industry is indicated by a reduction in sales of sheets by independent mills, during November, of approximately 50 per cent as compared with October, a reduction of 33 per cent in production and of about 30 per cent in shipments, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers.

Unfilled orders on Dec. 1 declined over 80,000 tons as compared with Nov. 1. Unshipped orders increased slightly.

Production in November decreased to a point slightly below shipments. Sales during the month were 134,391 tons, compared with 258,810 tons during October. Production dropped to 204,071 tons, compared with 319,660 tons during the previous month. November shipments were 207,200 tons, against 291,135 tons during October. The November report and comparisons in net tons follow:

	Nov.	Oct.	Sept.
Total number of mills.	708	712	715
Capacity per month...	461,800	498,300	459,075
Percentage reporting...	67.1	67.3	67.4
Sales	134,391	258,810	274,568
Production	204,071	319,660	302,490
Shipments	207,200	291,135	301,330
Unfilled orders.....	395,696	478,038	522,803
Unshipped orders.....	107,056	106,216	111,042

Percentages of Capacity			
Sales	43.3	77.2	88.7
Production	65.8	95.3	97.7
Shipments	66.8	86.8	97.4
Unfilled orders.....	127.6	142.6	168.9
Unshipped orders.....	34.5	31.7	35.9
Unsold stocks.....	23.1	18.8	14.2

Commodity Prices Lowest in Two Years

Commodity prices in November are reported by the United States Bureau of Labor Statistics at 94.4, compared with 96.3 in October and with 96.7 a year ago. The November level is the lowest since July, 1927. The figures are based on the average of 1926 as 100 and cover prices on 550 items analyzed monthly by the bureau.

Of the ten major groups of commodities all showed declines from October with the exception of fuel and lighting and house-furnishing goods. Many of the drops were 2 or more points. Metals and metal products went from 103.6 to 102.3, but remained higher than the 101.7 of a year ago.

Of the components of this group the iron and steel factor, non-ferrous metals and automobiles showed declines, while agricultural implements and other metal products remained at the October level. Under building materials, structural steel showed no change.

Fabricated Steel—Structural and Plate

	November, 1929	October, 1929	November, 1928
Fabricated structural steel, orders, (a) net tons, computed.....	227,150	350,350	242,550
do., do., eleven months.....	3,534,300	....	3,041,500

do., blast furnaces.....	1,019	853	563
do., stacks and miscellaneous...	13,493	15,766	10,731

(a) United States Department of Commerce; figures are from 233 identical firms. (b) High record. (c) Exceeds 12 months, 1928 (3,126,200 tons). (d) United States Department of Commerce. (e) Largest figure in several years.

Machinery Markets and News of the Works

Tool Market Is Quiet

Sales in December Are Less in Volume Than Same Month Last Year

MACHINE tool bookings have receded further in the past week and in some cases December sales are somewhat less than in the corresponding month of 1928.

While the dullness is partly accounted for by the usual lull in buying at the Christmas season and the year-end inventory period, the hesitancy on the part of users to close for much equipment until the industrial outlook is better clarified is also an important factor.

In the New York district purchases have been confined chiefly to a few companies whose expansion programs have not been affected by the stock market debacle. In at least one instance contracts were placed for about $50,000 worth of tools.

Although builders do not expect much business from the automobile industry for some time, a fair amount of buying is expected from automobile parts makers. Farm machinery manufacturers are reported to be preparing programs for the ordering of new tool equipment. The Allis-Chalmers Mfg. Co. and the A. O. Smith Corporation, Milwaukee, also may be in the market soon.

The absence of many cancellations of orders indicates the relative stability of the market. One line of shapers has been advanced 10 per cent.

New York

NEW YORK, Dec. 23.—Some machine tool dealers in this district have had fairly good orders in the past week, though the bulk of the buying has come from a few sources. Wide distribution of buying which prevailed during a greater part of the year is not at present in evidence. December business, on the whole, has held up to a better volume than was expected. A few local offices whose December sales are low report that prospects for January are encouraging. Considerable business is pending that will not be released until after Jan. 1. The week's orders, one of which totaled nearly $50,000, were from substantial companies whose expansion programs have not been affected by the recent stock market collapse.

Board of Water Supply, Municipal Building, New York, has plans for pumping plant on Avenue Z, Brooklyn, to cost $100,000 with machinery. G. J. Gillespie is president.

Board of Education, Delmar, N. Y., is considering installation of manual training equipment in new junior high school to cost $250,000 for which plans will be drawn by Pember & Dembers, 126 Washington Avenue, Albany, N. Y., architects.

Consolidated Gas Co., 4 Irving Place, New York, is arranging an expansion and improvement program to cost $100,000,000, of which about $75,000,000 will be used for power plants, substations and other structures, including lines for electric division, and $25,000,000 for gas generating and distributing division.

Murcott & Campbell, 298 Union Avenue, Brooklyn, manufacturer of files, rasps, etc., has plans for new two-story plant, 120 x 125 ft., to cost about $65,000 with equipment. Tillion & Tillion, 415 Lexington Avenue, are architects.

I. M. Uppercu, president of Uppercu Cadillac Corporation, 70 Columbus Avenue, New York, representative for Cadillac automobile, and associates have organized Uppercu-Burnelli Aircraft Corporation, with capital of 1,000,000 shares of stock, no par value, and plans operation of plant for production of 12-passenger trimotored transport planes, including parts manufacture and assembling. Vincent J. Burnelli, aeronautical engineer, will be an official of new company.

Armstrong Electric & Mfg. Corporation, 25 West Broadway, New York, is disposing of a bond issue of $300,000, part of fund to be used for expansion in production.

Tomkins Brothers, Inc., 74 Passaic Street, Newark, building materials, has asked bids on general contract for one-story storage and distributing plant at Yonkers, N. Y., to cost about $60,000 with mechanical handling equipment, etc. Robert Bolton, 45 Branford Place, Newark, is architect.

Atlas Portland Cement Co., 25 Broadway, New York, has 1000 acre tract near Rochester, Minn., and is considering new mill at that location, to cost more than $1,400,000 with equipment. A power house and machine shop will be included.

General Cable Corporation, 420 Lexington Avenue, New York, has purchased plant and business of Peerless Insulated Wire & Cable Co., Pennington, N. J., and will consolidate with its Standard Underground Cable Co. division, with main plant at Perth Amboy, N. J. Acquired plant will be continued as branch works. Company has expansion program under way at Perth Amboy, including additional manufacturing units. Part of works at Pittsburgh will be removed to this location.

United Die & Tool Works, 10 Johnson Street, Newark, has leased part of four-story factory at 158-60 Summit Street and will remove to new location early in January.

J. Strum & Co., 65 Commercial Street, Newark, manufacturers of commercial automobile bodies and wagons, parts, etc., have purchased former plant of H. F. Sommer & Co., 225 Wilson Avenue, for new works and will remove to new location and increase facilities.

Gilby Wire Co., 122 Riverside Avenue, Newark, has completed a two-story addition and will install equipment for production of fine wires, including wire mesh manufacturing division, to cost more than $40,000.

Art Wire & Stamping Co., manufacturer of wire specialties, recently moved from 449 Central Avenue, Newark, to 119 Coit Street, Irvington, N. J. Company also does metal stamping.

Reed-Prentice Corporation, Worcester, Mass., machine tool manufacturer, has moved its New York sales office to 41 Broad Street.

New England

BOSTON, Dec. 23.—Machine tool dealers are receiving some good inquiries for one and two-tool lots, and the outlook for business early next year is more encouraging. Inquiries include large lathes, boring machines, radial drills, and at least one large planer. Current activity is confined to an occasional small tool on which comparatively early delivery can be made. The used tool market is quiet.

Reid Brothers, Beverly, Mass., have started work on a one-story machine shop, 60 x 200 ft., to cost $20,000 without equipment.

Norwood Press Co., Norwood, Mass., will soon ask bids on a one-story foundry addition, 26 x 62 ft., and other extensions.

New Bedford Gas & Edison Light Co., New Bedford, Mass., contemplates building a power plant addition early next year. A crane is under consideration.

Standard Mailing Machine Co., Everett, Mass., has started work on an addition, 65 x 80 ft.

Hartford Empire Co., Hartford, Conn., has plans for a one-story steel storage plant, 40 & 100 ft., for which conveying equipment will be required.

In connection with an expansion program, New York, New Haven & Hartford Railroad Co., New Haven, Conn., is arranging fund of $1,000,000, for new steam-operated electric power plant for shop service, and extensions in steam-heating facilities at repair shops.

United States Bobbin & Shuttle Co., Lawrence, Mass., manufacturer of textile mill equipment, will concentrate production at local plant in future and will discontinue operations at branch works at Lowell, Mass. Machinery from last noted plant will be removed to Lawrence.

Church Mfg. Co., Holyoke, Mass., manufacturer of sanitary ware, has begun work on an addition, to cost about $50,000 with equipment.

Chicago

CHICAGO, Dec. 23.—Both sales and inquiries continue to taper as buyers defer machine tool programs until after the first of the year. Some dealers find December the dullest twelfth month in two years, while others report it only moderately under December, 1928. The contrast between the closing month of 1928 and this year lies in the fact that sales in the past few months have been gradually tapering, whereas the opposite was the condition in the closing months of 1928. The absence of cancellations indicates the relative stability of the market. Prices tend upward with the announcement this week of a 10 per cent advance on one line of shapers.

The Caterpillar Tractor Co., Peoria, Ill., may buy some tools before the new year starts. Inquiries from other farm machinery manufacturers are promising. Allis-Chalmers Mfg. Co., and A. O. Smith Corporation, both of Milwaukee, have well shaped programs. Local dealers show no concern over the outlook for the early part of the next year.

Tips Tool Co., Taylorville, Ill., has placed a general contract for a foundry building, 25 x 40 ft.

Harry W. Leighton Co., Chicago, Ill., has recently been incorporated as representative in Illinois, Indiana, Michigan, Wisconsin and Iowa for Cleveland Steel Tool Co., Cleveland; Buckeye Portable Tool Co., Dayton Pneumatic Tool Co., Precision Gauge & Tool Co., all of Dayton, Ohio, and Schauer Machine Co., Cincinnati. Harry W. Leighton is president and treasurer; William E. Thurber, for a number of years manufacturers' representative in Chicago territory for Colonial Tool & Steel Co., is vice-president and secretary.

American Boiler & Tank Co., Chicago, has purchased property south of Clearing Industrial District for future development.

Garden City Plating & Mfg. Co., 1430 South Talman Avenue, Chicago, has leased space in adjoining building, totaling 23,000 sq. ft., for expansion.

Illinois Power & Light Corporation, 231 South La Salle Street, Chicago, is disposing of a bond issue of $5,000,000, part of proceeds to be used for expansion and improvements in power plants and transmission lines.

Board of Education, Iowa State Bank Building, Burlington, Iowa, has plans for a two-story and basement vocational school, to cost about $45,000 with equipment. W. F. Weibley, Tama Building, is architect. William B. Ittner, 911 Locust Street, St. Louis, is consulting architect.

Raymer Hardware Co., 58 East Fifth Street, St. Paul, Minn., has leased one-story building to be erected on University Avenue for establishment of a storage and distributing plant, to cost $40,000. Lang, Raugland & Lewis, 1953 University Avenue, are architects.

Southern Colorado Power Co., Colorado Building, Pueblo, Colo., plans extensions and improvements in power plants at Pueblo, Canon City and Skaguay, to cost $150,000 with equipment. Engineering department of company is in charge.

Western Electric Co., Hawthorne, Ill., has awarded general contract to H. K. Ferguson Co., Cleveland, for automobile service and garage building at works, 137 x 176 ft., for company cars, motor trucks and trailers, to cost about $100,000. Present garage unit will be converted for manufacturing.

Board of Education, City Hall, Minneapolis, has plans for an equipment, repair and supply shop, with metal, woodworking and other departments, to cost $250,000 with equipment. Bureau of Buildings, Division of Design and Inspection, 245 Ninth Avenue North, is in charge.

Atchison, Topeka Santa Fe Railway Co., 80 East Jackson Boulevard, Chicago, has begun work on new engine house at Fort Madison, Iowa, with one-story locomotive service and repair shop, 30 x 170 ft., for which general contract recently was let to A. W. Smith & Son, Fort Madison, to cost about $100,000 with equipment.

Lourie Mfg. Co., 565 Washington Boulevard, Chicago, plans a large expansion program in 1930, not only in plant equipment but in manufacture of new lines. Present products include hydraulic machinery, high-speed and heavy-duty presses and high-pressure pumps. O. C. Keckley, president, who purchased a controlling interest in company in 1928, reports that 1929 business showed an increase of 100 per cent over that of preceding year, and that a large volume of unfilled orders will be carried over into new year.

The Crane Market

NO new inquiries of consequence have appeared in the past week for either electric overhead cranes or locomotive cranes. Of the pending business, sellers expect but little to be placed before the end of the year. The Standard Oil Co. of New York has purchased a 15-ton, 37-ft. 9-in. span hand power crane for Ingleside, Tex., and has been taking bids on a 5-ton electric crane for Baytown, Tex. In the locomotive crane field, the Boston & Albany Railroad, has closed on a 20-ton locomotive crane.

Among recent purchases are:

S. S. Hepworth Co., New York, two 2-ton, 1-motor, underhung cranes for a new plant in Long Island City from H. D. Conkey & Co., through Florandin Equipment Co.

Walling Transportation Lines, Tottenville, S. I., New York, 5-ton, 3-motor, underhung crane from H. D. Conkey & Co., through Florandin Equipment Co.

Boston & Albany Railroad, Albany, N. Y., 20-ton locomotive crane with bucket, reported from Ohio Locomotive Crane Co.

Blackhawk Machine & Foundry Co., Davenport, Iowa, has recently completed an extension costing $50,000 which provides 18,000 additional sq. ft. of floor space. Company specializes in gray iron and aluminum castings and maintains an experimental laboratory.

Milwaukee

MILWAUKEE, Dec. 23.—The holiday season has accentuated the relatively quiet tone of the machine tool market, but a general improvement is looked for after the first week in January. Inquiry the past week has been in fair volume. With the two holidays coming in midweek, production schedules are interrupted to an extent hardly warranted by orders on hand and delivery specifications.

Walter E. Lippmann, 432 Herman Street, Milwaukee, has organized Lippmann Engineering Works to manufacture sand and gravel washing machinery, coal and ash handling plants and similar special machinery. A site has been purchased in West Milwaukee, and contracts have been placed for a one-story plant, 90 x 200 ft., costing about $65,000 with equipment. Inquiry is being made for a 5 to 10-ton traveling crane, and after Jan. 1 on other machinery.

Milwaukee Stamping Co., 300 Sixty-fourth Avenue, West Allis, Milwaukee, manufacturer of automobile and builders' hardware, finished stamping specialties and dies, has taken over Litterer Brothers Mfg. Co., 3022-3032 North Rockwell Street, Chicago, and is consolidating operation in Milwaukee works. Litterer company's main product is metal partitions. While no new construction will be done at Milwaukee for present, additions to equipment of this department will be made. Chicago plant will be retained as a storage and shipping warehouse and a branch office. Ben A. Otten is secretary of Milwaukee company.

J. F. Devine Pattern Mfg. Co., 5911 Greenfield Avenue, West Allis, Milwaukee, manufacturer of wood and metal patterns, templates, etc., is building a one-story addition, 45 x 100 ft.

Gray iron foundry of the McNally-Tollefson Co., Stoughton, Wis., operated for two years as a division of Liberty Foundry Co., Inc., Sixty-sixth and State Streets, Milwaukee, with a branch plant at Waukesha, Wis., has reverted to McNally-Tollefson interests and henceforth will operate in conjunction with Stoughton Co., Stoughton. This company is transferring its gray iron work to McNally-Tollefson shop, and is now concentrating on non-ferrous casting. Gray iron shop specializes in cylinder blocks, pistons and other internal combustion engine castings. J. E. McNally is general manager.

Butler Bin Co., Waukesha, Wis., manufacturer of steel bins and gravity loading devices for sand and gravel pits, concrete contractors, etc., will enlarge its plant at a cost of about $40,000 early in 1930. Detailed plans are in formation.

Jacobsen Mfg. Co., Eighth Street and Washington Avenue, Racine, Wis., manufacturer of power driven lawn mowers, is erecting a two-story addition costing about $40,000, to be used largely for office purposes and experimental shop. Company recently completed alterations of a four-story shop building acquired from Murray Body Corporation, with 93,000 sq. ft. Some additional equipment for this shop is being purchased from time to time.

Buffalo

BUFFALO, Dec. 23.—Sikes-Cutler Desk Corporation, 20 Churchill Street, Buffalo, has filed plans for a one-story addition to cost about $35,000.

Niagara Falls Power Co., Niagara Falls, N. Y., operated by Buffalo, Niagara & Eastern Power Corporation, Electric Building, is planning construction of steam-operated electric power plant near station of Buffalo General Electric Co., an affiliated organization, to cost over $500,000 with equipment.

Meyer-Smith, Inc., Buffalo, has been organized with capital of $500,000, to take over and consolidate Smith Supply & Equipment Co., Inc., 50 Broadway, and A. F. Meyer & Son, 408 Broadway, manufacturers of refrigerators, meat market equipment and fixtures soda fountain apparatus, etc. New company will concentrate production at last noted location, and will operate storage and distributing plant at 294-98 Pratt Street; increased output will be arranged. Edward J. Meyer is president, and George M. Wiedmer, vice-president and treasurer.

Alfred C. and J. Victor Coty, 260 Flower Avenue East, Watertown, N. Y., have organized Coty Machine Co., with capital of $200,000, and plan early operation of general machine works for production of finished iron and steel products. T. Earl Coty, 211 Arlington Street, will be an official of new company.

LaFrance-Republic Sales Corporation, Elmira, N. Y., manufacturer of motor trucks, with main plants at Alma, Mich., and Bloomfield, N. J., has leased building at Frelinghuysen Avenue and Hunter Street, Newark, N. J., for new factory branch, service and garage building.

Weber Machine Corporation, Rochester, N. Y., manufacturer of Syncrodisk talking picture devices, has acquired additional space of 15,000 sq. ft. in Likly Building on Lyell Avenue, for assembly and shipment of Syncrodisk turntables. Company will also soon commence production and marketing of a "sound on film" device.

International Business Machines Corporation has approved plans for an addition to its factory at Endicott, N. Y., to cost about $700,000.

Philadelphia

PHILADELPHIA, Dec. 23.—Monarch Mfg. Works, Inc., Salmon Street, Philadelphia, general machinist, has awarded general contract to A. Earl Barnes Co., 2044 East Clementine Street, for one-story machine shop addition, to cost about $20,000 with equipment.

Barrett Co., Thirty-sixth Street and Grays Ferry Avenue, Philadelphia, manufacturer of roofing products, etc., is planning to rebuild plant unit recently destroyed by fire, with loss reported over $400,000 including equipment.

Springfield Metallic Casket Co., Springfield, Ohio, has leased building at 1411-17 Spring Garden Street, Philadelphia, for new factory branch, storage and distributing plant.

American Ice Co., City Center Building, Philadelphia, is arranging for expansion to cost $1,500,000, including erection of three electrically-operated ice-manufacturing plants at East Boston, Mass., for Boston Ice Co., a subsidiary, and on East Sixtieth Street and East River, New York, for Knickerbocker Ice Co., another subsidiary; work on last noted has begun.

C. F. Simonin's Sons, Inc., Tioga and Belgrade Streets, Philadelphia, manufacturer of vegetable oils, etc., is planning to rebuild part of plant destroyed by fire Dec. 16, with estimated loss of $100,000 with equipment.

McCloskey Varnish Co., Thirtieth and Locust Streets, Philadelphia, has plans for a two-story factory, on site 150 x 600 ft., at Holmesburg Junction, to cost about $150,000 with equipment, and will remove to new location and increase capacity.

Shell Eastern Petroleum Products Co., 122 East Forty-second Street, New York, is concluding arrangements for purchase of property near Trenton, N. J., as site for oil storage and distributing plant, to cost over $80,000 with equipment.

Board of Trustees, Hill School, Pottstown, Pa., will take bids in about 60 days for new power plant, to cost about $40,000 with equipment. C. Z. Klauder, 1429 Walnut Street, Philadelphia, is architect.

Philadelphia Range Boiler & Steel Tank Co., Philadelphia, has been organized with capital of $50,000 to take over and expand company of same name, with plant at 2656 Salmon Street.

School Board, Hellertown, Pa., is considering installation of manual training equipment in new two-story junior high school, to cost about $135,000, for which plans will be drawn by Jacoby & Everett, Commonwealth Building, Allentown, Pa., architects.

Reilly-Whiteman Co., Canal Bank, Conshohocken, Pa., manufacturer of oils, greases, etc., is planning new two-story plant at Spring Mill, Pa., to cost about $70,000 with equipment.

Board of Trustees, University of Delaware, Newark, plans addition to steam power plant to cost $75,000. Appropriation has been authorized.

Pittsburgh

PITTSBURGH, Dec. 23.—Machinery business has been very quiet in the last few days and practically no activity is expected this week. A fair volume of inquiry is in the hands of dealers, but no action is expected on this before next month and practically no new work is coming out now. The first quarter list of the Westinghouse Electric & Mfg. Co. is expected in a few days, but local dealers have no intimation as yet regarding its size. Reports from railroads in the Pittsburgh district are encouraging and dealers look for inquiry from this source early in the year.

Heavy machinery and equipment builders in this district will enter 1930 with the best order books in several years and with the prospect of continued activity. No action has been taken on a number of steel mill expansion programs announced in the last few weeks and orders for machinery on these jobs will likely be placed in the first quarter. Prominent among the projects definitely assured are the $7,000,000 program of the Weirton Steel Co., Weirton, W. Va., the new sheet mill to be erected at Tarentum by the Tarentum Steel Corporation, an extensive program to be undertaken by the American Steel & Wire Co. at Donora, Pa., and extensions and improvements at the Etna, Pa., works of Spang, Chalfant & Co., Inc.

Dravo Contracting Co., Neville Island, Pittsburgh, operating a plant for construction of barges, tugs, etc., is planning extensions in marine ways and will provide additional shop facilities.

Westinghouse Electric & Mfg. Co., East Pittsburgh, is arranging an expansion and improvement program to cost $10,000,000, including plants in this vicinity and branch factories in different parts of country. Early in January company will begin commercial production of new electric refrigerator, including parts and assembling. Work has begun on eleven-story electrical and mechanical laboratory, 80 x 225 ft., at Pittsburgh, to cost $1,500,000 with equipment.

Segal Lock & Hardware Co., 155 Leonard Street, New York, with Lenox Tile Co., 114 East 124th Street, same city, and Charles H. De Voe, formerly head of Old Bridge Enamel Brick & Tile Co., Old Bridge, N. J., have acquired plant and business of Kenilworth Tile Co., Newell, W. Va. New owners will reorganize company and plan expansion.

Duquesne Light Co., 435 Sixth Avenue, Pittsburgh, is arranging an expansion program to cost about $700,000, including additional generating facilities, power substations and transmission lines.

Monongahela County School Board, Morgantown, W. Va., plans installation of manual training equipment in new high school on West Virginia University Campus, for Cass, Grant and Union Districts, to cost $300,000. Davis, Dunlap & Barney, 1805 Walnut Street, Philadelphia, are architects.

Technical Products Co., Pittsburgh, maker of acid-proof cements, is occupying a new factory at 2308 Main Street.

South Atlantic

BALTIMORE, Dec. 23.—Kitchen Cabinet Corporation, Baltimore, headed by F. X. Ganter, president of F. X. Ganter Co., Sharp and Ostend Streets, manufacturer of show cases, etc., has plans for extensions and improvements in factory at Hillsdale, to cost over $35,000. William Ganter and Associates, 210 East Lexington Street, are architects.

Appalachian Electric Power Co., Roanoke, Va., is arranging an expansion program to cost about $500,000, including addition to steam-operated electric generating plant at Glen Lyn, W. Va., extensions in other power stations, substations and transmission lines at Bluefield, Welch, W. Va., and vicinity.

Aeronautical Retarding Gear, Inc., 507 East Franklin Street, Richmond, Va., recently organized by R. T. Lipscombe, industrial engineer, and associates, has purchased 40-acre tract near city limits, part of site to be used for establishment of new plant to manufacture mechanical devices and equipment for aircraft; an aircraft assembling plant is also planned, entire project to cost more than $50,000 with equipment.

American Oil Co., American Building, Baltimore, has plans for new storage and distributing plant at Greensburg, Pa., to cost about $60,000 with equipment. T. J. O'Connell is company engineer.

Davison Chemical Co., Garrett Building, Baltimore, is arranging an expansion program for Southern Phosphate Corporation, Bartow, Fla., a subsidiary, for development of phosphate rock properties in Polk County, Fla., and opening of similar deposit near Bartow, entire program to cost over $400,000 with conveying machinery, loading equipment, mechanical conveyors, etc. Davison company will also complete construction of new fertilizer plant now under way at Houston, Tex., to represent an investment of $1,000,000.

Vidalia Coca Cola Bottling Co., Vidalia, Ga., has plans for new one-story bottling

plant, to cost about $55,000 with conveying, elevating and other mechanical equipment. Pringle & Smith, Norris Building, Atlanta, Ga., are architects.

Shenandoah River Power Co., Harrisonburg, Va., will begin work in 60 or 90 days on new hydroelectric generating plant on Shenandoah River, to cost over $300,000 with transmission line. L. E. Long is general superintendent.

Board of Education, Baltimore, plans installation of industrial art and manual training department in new school at Brehm's Lane and Chesterfield Avenue, to cost about $300,000 for which superstructure will soon be placed under way. McKenzie & Cross, Professional Building, are architects.

City Council, Danville, Va., has plans for additional hangars and mechanical shops at municipal airport, to be occupied under lease by Lynchburg Flying Service, Inc., Lynchburg, Va., to cost more than $45,000 with equipment.

Shell Eastern Petroleum Products Co., 122 East Forty-second Street, New York, is said to be arranging for purchase of oil storage and distributing plant of Mecklenburg Oil Co., Charlotte, N. C., and plans extensions and installation of additional equipment.

New construction costing $16,000,000 is planned for 1930 by Georgia Power Co., and affiliated companies, Columbus Electric & Power Co., and South Georgia Power Co. This will be largest amount spent by company in any single year of its history. A steam plant in Atkinson, near Atlanta, and a hydroelectric plant at Furman Shoals, near Milledgeville, are chief among 1930 construction plans.

Detroit

DETROIT, Dec. 23.—Kelsey Wheel Co., 3600 Military Avenue, Detroit, manufacturer of steel automobile wheels, has plans for a one and two-story addition, 300 x 800 ft., to cost more than $450,000 with machinery. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Ziv Steel & Wire Co., 2945 West Harrison Street, Chicago, has plans for new branch plant at Meyers Road and Union Belt Railroad, Detroit.

Lansing Steel Corporation, Lansing, Mich., has plans for a one-story unit for structural steel fabrication and ornamental iron work, to cost about $30,000 with equipment.

Detroit Aircraft Corporation, Union Trust Building, Detroit, has purchased plant and business of Gilders, Inc., Orion, Mich., manufacturer of airplane equipment and will consolidate. Orion plant will be removed to main works at Detroit where production will be concentrated.

Hill Diesel Engine Co., Lansing, manufacturer of Diesel engine units, parts, etc., has arranged for increase in capital from $125,000 to $1,000,000, part of fund to be used for general expansion.

Accuralite Co., Muskegon, Mich., manufacturer of pistons, automobile engine pistons, etc., is considering one-story addition to cost more than $30,000 with equipment.

Hospital Commission, Dearborn, plans power plant and mechanical laundry at new institutional building, entire project to cost $1,000,000. Smith, Hinchman & Grylls, Marquette Building, Detroit, are architects and engineers.

Scott Engineering Co. Lindbergh Field, Kalamazoo, Mich., aircraft equipment, has awarded general contract to O. F. Miller, Kalamazoo, for one-story plant unit, to cost about $25,000.

Timken-Detroit Axle Co., West Fort Street, Detroit, has plans for a two-story addition, 100 x 100 ft., to cost more than $85,000 with equipment.

Indiana

INDIANAPOLIS, Dec. 23.—Connersville Blower Co., Connersville, manufacturer of rotary blowers, rotary pumps, gas boosters, etc., is considering one-story addition to cost over $35,000 with equipment.

Standard Oil Co. of Indiana, Inc., 910 South Michigan Avenue, Chicago, has approved plans for one-story addition, 50 x 150 ft., to refinery at Whiting, Ind., for acid concentrating plant, to cost about $60,000 with machinery.

Electric Steel Castings Co., Speedway City, Indianapolis, will begin superstructure for a one-story addition, 54 x 200 ft., to cost about $50,000 with equipment, general contract recently let to Hetherington & Berner, 701 Kentucky Avenue.

Apex Stamping Co., Crawfordsville, manufacturer of metal stampings, is considering one-story plant at Elmore Street, to cost about $30,000 with equipment.

Municipal Airport Department, City Hall, Indianapolis, Paul Moore, superintendent, will soon begin erection of hangars, with repair facilities and administration building at municipal airport, Natonal Road, Ben Davis, about seven miles from city, to cost about $100,000 with equipment. McGuire & Shook, 941 North Meridian Street, are architects.

Buhner Fertilizer Co., Jeffersonville Avenue, Seymour, will erect one-story plant, 60 x 250 ft., to cost about $40,000 with equipment.

Cleveland

CLEVELAND, Dec. 23.—Machine tool sales and inquiry fell off the past week. However, several single tool orders were placed. The quieting down that usually occurs during the holiday season is in evidence and not much activity is looked for during the remainder of the month. Outlook for the early part of January appears promising as a number of inquiries are pending for fair sized lots of tools. While machinery manufacturers do not look for much business from motor car builders for some time, a fair amount of buying is expected from some of the parts manufacturers.

Accural Metal Products Co., Terminal Tower Building, Cleveland, has plans by Ernest McGeorge, 3030 Euclid Avenue, architect and engineer, for a one-story plant, 95 x 200 ft., to cost about $50,000 with equipment.

Tuscan Tire & Rubber Co., Carrollton, Ohio, is considering call for bids early in January for rebuilding part of plant recently destroyed by fire, new unit to be one-story, 40 x 180 ft.

Board of Education, Shady Side, Ohio, is considering installation of manual training equipment in new high and grade school, to cost about $175,000. J. E. Lewis, 205 Cleveland Avenue, N. W., Canton, Ohio, is architect.

Ohio Injector Co., Wadsworth, Ohio, is contemplating one-story addition to steam specialty manufacturing plant, to cost more than $50,000 with equipment.

Lewis Machine Co., Cleveland, has moved from 6303 Central Avenue to 1600 East Twenty-fourth Street.

St. Louis

ST. LOUIS, Dec. 23.—Union Electric Light & Power Co., Twelfth and Locust Streets, St. Louis, has plans for one-story equipment storage and distributing plant, 160 x 300 ft., including garage, service and repair unit, to cost over $120,000 with equipment. Beaume & Klein, American Trust Building are architects.

Home Convenience Mfg. Co., 1423 Illinois Avenue, Kansas City, Mo., recently formed by Philip D. Morelock of Shouse, Doolittle & Morelock, Land Bank Building, and associates, plans early operation of local factory for production of metal domestic specialties, including hand-operated washing machines and parts, bread-slicing devices, etc. E. B. Jones, inventor, will be identified with company.

Empire Gas & Fuel Co., Bartlesville, Okla., has begun construction of aviation field on 400-acre tract and plans hangar, with repair and reconditioning facilities, and other mechanical field units, to cost more than $65,000 with equipment.

Metal-Air Corporation, Oklahoma City, Okla., is considering construction of one-story aircraft manufacturing plant, including parts and assembling departments, to cost over $80,000 with equipment.

City Commission, Morrilton, Ark., will soon take bids for municipal steam-operated electric power plant, to cost about $100,000. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is consulting engineer.

Wheat Farming Co., Hays, Kan., Fred Beeby, head, plans construction of grain elevator, including conveying, elevating and screening equipment, with one-story machine shop on adjoining site, 40 x 75 ft., entire project to cost over $60,000.

Carter-Waters Co., 2049 Main Street, Kansas City, Mo., road-building materials and supplies, will soon take bids on general contract for a four-story storage and distributing plant, 75 x 100 ft., to cost over $100,000 with equipment. Archer & Gloyd, Pioneer Building, are architects.

Missouri & North Arkansas Railroad Co., Harrison, Ark., will proceed with superstructure for engine house, 75 x 100 ft., with shop facilities at Kennett, Ark., to cost about $70,000 with equipment. H. J. Armstrong is chief engineer.

Reeves & Skinner Machinery Co., St. Louis, has been appointed by American Fluid Motors Co., Philadelphia, as its sales representative for Hele-Shaw pumps in Missouri and southern Illinois.

The St. Louis-San Francisco Railway Co., St. Louis, B. T. Wood, vice-president and chief purchasing officer, is taking bids until Jan. 10 on the following equipment:

One 100-in. 600-ton wheel press with a 15 hp. Allis-Chalmers motor.

One 9-in. motor-driven bench type lathe, similar to South Bend model.

One 3/16-in. power ring and circular shears, similar to Peck, Stow & Wilcox No. 537.

Three radius link grinding machine, similar to H. G. Hammet's.

One bending brake, similar to Dries & Krump No. 207, with 10-hp. motor.
